Intermediate Frequency Adjustments

1. Turn the tuning control to the extreme low frequency position. (Variable capacitor plates all the way in).
2. Connect the ground terminal of the signal generator to the common buss. (Black and White wire).
3. Introduce a modulated signal of 455 kilocycles using a .01 mfd. capacitor in series with the lead from the signal generator to the modulator grid, terminal No. 8, of the 12SA7 tube.
4. Adjust the I.F. Aligners for maximum output in the following order:
   A. Secondary of second I.F. Transformer.
   B. Primary of second I.F. Transformer.
   C. Secondary of first I.F. Transformer.
   D. Primary of first I.F. Transformer.

Dial Pointer Adjustments

1. Disconnect the .01 mfd. capacitor in series with the signal generator, disconnect signal generator ground from black and white buss. Connect both signal generator lead and ground lead to an 8 inch radiating loop. *(1 turn)*. Place the radiating loop close to the antenna of the receiver.
2. Turn the plates of the gang tuning capacitor full out *(complete clockwise rotation)*.
3. Set signal generator to 1580 kilocycles and adjust oscillator trimmer for maximum output. Now set signal generator to 1400 kilocycles and tune set to receive 1400 kilocycle signal. Adjust pointer to center of 1400 kilocycles calibration on dial.

Radio Frequency Adjustments

1. Leave signal generator loop connected in same position as for dial pointer adjustment.
2. Set signal generator and receiver tuning dial to 1400 kilocycles.
3. Adjust the oscillator, radio frequency and antenna trimmers for maximum output.
4. Set both the signal generator's frequency and the receiver's tuning dial to a 600 kilocycles and check calibration.

Note: If the calibration is too far off at 600 kilocycles, operations 2 and 3 may be repeated until the best results are obtained.

MODELS 1121 Series

STROMBERG CARLSON CO.

ALIGNING

Never realign unless absolutely necessary.

Refer to "Location Chart" for alignment adjusters. Allow set to warm up 10 to 15 minutes before attempting to align.

Always align using the smallest possible input from the signal generator. *A strong signal makes adjustments approximate.*

Always have volume full on.

The alignment of this receiver does not require special equipment or information; however, it is well to adhere to the standard procedure as outlined.

The required equipment is: 1 Electronic Voltmeter, 1 Output Meter, 1 Standard Signal Generator, 1 High Frequency Signal Generator, 1 No. 80777 Aligning Tool.

Aligning Procedure *(follow this order exactly)*

Intermediate Frequency Adjustments
Amplitude Modulation

The I.F. aligners that are used to adjust the amplitude modulation (AM) channel are found on the top side of the chassis. They consist of 6 adjustable iron cores used to tune the inductance of the 1st, 2nd & 3rd I.F. transformers (161202, 161200, 161201). These cores are found inside the plastic tubes protruding from the top of the I.F. transformers and are equipped with small screwdriver slots.

Caution: These cores are made of high quality R.F. iron and are fragile; therefore care must be used in adjusting them.

1. Connect the signal generator to the modulator grid, terminal number 8 of the 6SB7 converter tube which is connected to the wave band switch, and is identified by a blue dot.
2. Connect the output meter across the voice coil of the speaker (green and black wires from cable).
3. Adjust the signal generator to 455 KC. Use 30% modulation at 400 cycles.
4. Adjust volume control full on.
5. Adjust tone control to maximum high (counter clockwise).
6. Adjust range switch to standard broadcast band, (second position clockwise.)
7. Adjust the tuning selector to approximately 600 KC.
8. Adjust I.F. cores for maximum output with a reduced signal Input.

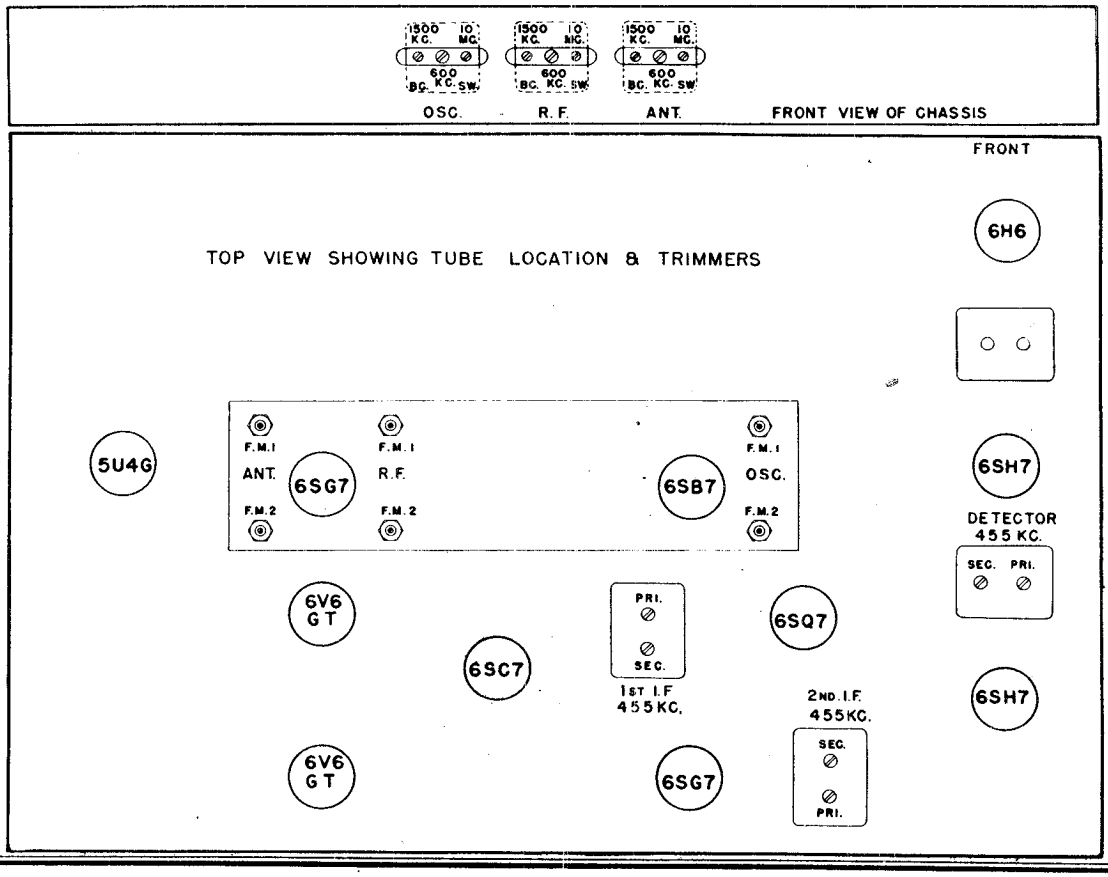
Frequency Modulation

The I.F. Aligners may be found from the underside of the chassis. The adjusters are 6 Iron cores used to tune the inductance of the high frequency coils.

1. Connect the signal generator to the modulator grid, terminal number 8 of the 6SB7 converter tube, which is connected to the wave band switch, and is identified by a blue dot.

LOCATION CHARTS

TUBES, TRIMMERS AND VOLTAGE



©John F. Rider

STROMBERG CARLSON CO.

2. Connect the electronic voltmeter to the junction of the 22,000 and the 4,700 ohm resistors in the limiter grid circuit, identified by a green dot.
3. Adjust the voltmeter to the lowest negative voltage scale.
4. Turn the range switch to the 2nd F.M. band (fourth position clockwise).
5. Adjust the tuning selector to approximately 21 on this band.
6. Adjust the signal generator to 10.7 megacycles. No modulation is required.
7. Adjust the cores for maximum output of the voltmeter. Reduce the input signal and readjust until the maximum output is secured for minimum input.

Discriminator Alignment (FM)

1. Connect the signal generator to the grid of the second I.F. tube, terminal No. 4 of the 6SH7.
2. Connect the electronic voltmeter to the center of the diode load resistors at the point indicated by the orange dot.
3. Adjust the primary for maximum output with the signal generator set at 10.7 megacycles.
4. Switch the electronic voltmeter to the high side of the diode load resistors, identified by a red dot.
5. Adjust the secondary for zero output.
6. Swing generator to 75 KC higher and 75 KC lower in frequency and note the plus and minus voltage. If these voltage values are not approximately equal, repeat operations 3, 4 and 5.

Dial Pointer Adjustment

Check dial pointer to see that it is aligned through the center of the 2 in the number 201 of FM Band (1) when the variable capacitor plates are completely engaged.

R.F. Adjustment — Amplitude Modulation

The Broadcast band should be adjusted first.

The built-in loop should remain connected to the antenna and ground terminals.

1. Connect the signal generator to the antenna terminal, using a 200 mmf. capacitor. Use 30% modulation at 400 cycles.
2. Adjust the signal generator to 1500 KC.
3. Adjust station selector to 1500 KC.
4. Adjust range switch to AM Broadcast. (Second position clockwise.)
5. Adjust the oscillator, R.F. and antenna trimmer for maximum output.
6. Reduce the input signal and readjust the trimmers until the maximum output is secured for minimum input.
7. Adjust station selector to 600 KC.
8. Set signal generator to 600 KC.
9. Adjust iron cores in oscillator, R.F. and antenna coils for maximum output.
10. Repeat 1500 KC and 600 KC alignments until no further change is required.

R.F. Adjustment — Short Wave

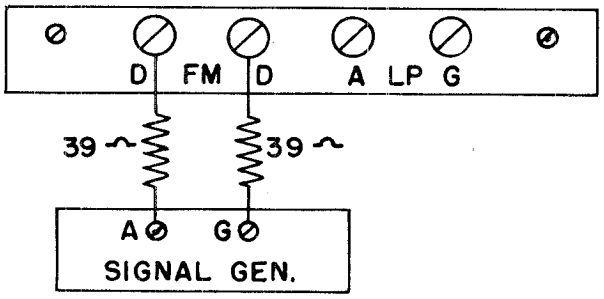
The built-in loop should remain connected to the antenna and ground terminals.

1. Connect the signal generator to the antenna and ground terminals of the receiver using a 400 ohm resistor.
2. Set the dial pointer to 9.5 megacycles.
3. Adjust signal generator to 9.5 megacycles.
4. Adjust range switch to Short Wave (first position clockwise).
5. Adjust oscillator, R.F., and antenna trimmer for maximum output. (No further alignment is required on this band.)

R.F. Adjustments — Frequency Modulation

Align the FM (2) Band first.

1. Set the dial pointer to 61.
2. Connect the signal generator to FM dipole terminals using 39 ohm resistors as indicated. (Disconnect dipole antenna.) *Connect Signal Generator ground to chassis ground.*
3. Set signal generator to 46.1 megacycles.
4. Adjust range switch to FM (2) (fourth position clockwise).
5. Connect the electronic voltmeter to the junction of the 22,000 and 4,700 ohm resistors in the limiter grid circuit. (Identified by green dot.)
6. Adjust oscillator R.F. and antenna trimmers for maximum output on electronic voltmeter.



FM (1) Band

Adjust the same as the FM (2) band using 100.1 megacycles, setting the dial pointer to 261. Connect the generator to the dipole input using 39 ohm resistors as indicated. *Connect Signal Generator ground to chassis ground. Note reversed Signal Generator connection.*

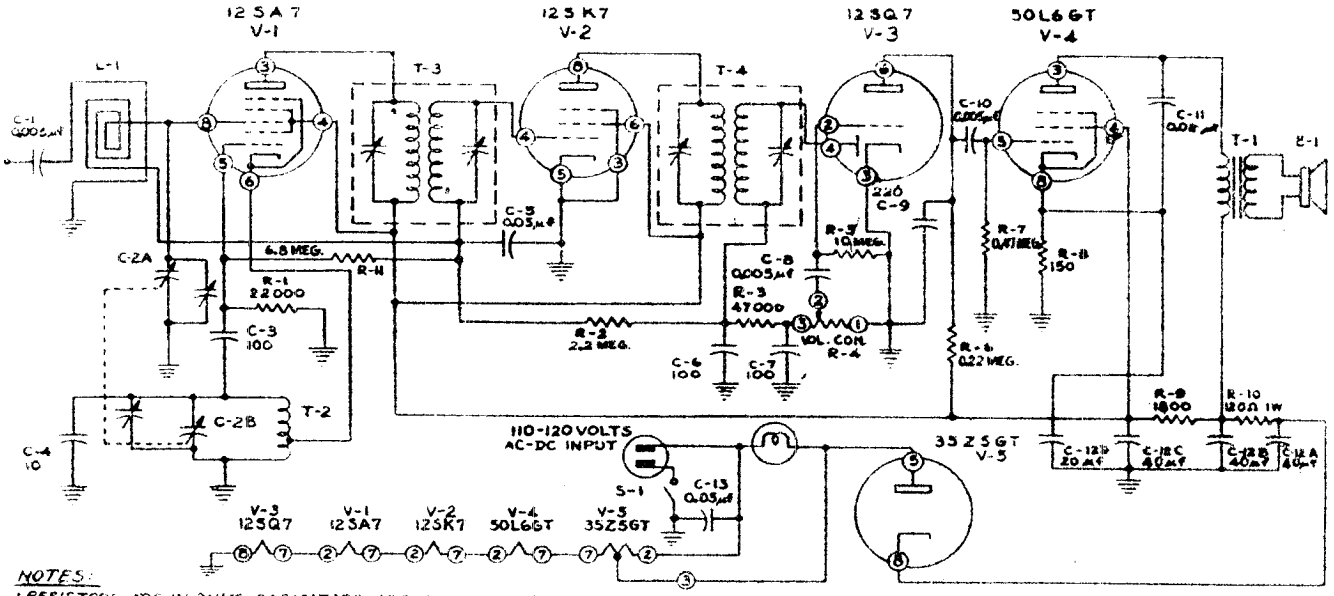
Record Changer: Detrola Model 550

©John F. Rider

MODELS E-510 to E-519 Inclusive

TEMPLETONE RADIO MFG. CORP.



NOTES:
1. RESISTORS ARE IN OHMS, CAPACITORS ARE IN μμf, INDUCTORS ARE IN μH UNLESS OTHERWISE MARKED.
2. VOLUME CONTROL R-4 IS 0.5 MEGOHMS, WITH SWITCH S-1 MOUNTED ON REAR.
3. IN A FEW EARLY MODELS C-12D WAS A SEPARATE 25μf CAPACITOR, C-12A WAS 80μf, C-12C WAS 20μf AND R-11 WAS NOT USED.

IF PEAK 455 KC

Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception. An output meter may be clipped directly across the voice coil lugs.

The Signal Generator may be connected through a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section (B) of tuning capacitor. Connect ground clip of generator directly to chassis. Align the I. F. trimmers to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad.

To align RF trimmers, remove the 0.01 mf capacitor and connect the Signal Generator leads or two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and pointer at extreme left end of travel, adjust the oscillator trimmer (A) (on front section of tuning capacitor) to 1700 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (B) (on rear section) for maximum response. With tuning capacitor plates fully meshed, the receiver should tune to 535 kc; however, no adjustment is required at this point. For checking purposes, four fine marks are engraved on the dial plate. These represent, in order, the pointer settings for 1550, 1000, 600 kc, and the pointer position with capacitor plates fully meshed.

V-6	No. 51	Dial Lamp	

Operation: The set operates on 110 to 120 volts, 50 or 60 cycles A. C. and 110 to 120 volts D. C. Power drain is approximately 25 watts.

When operated on direct current (D. C.), if no reception is obtained after approximately one minute of warm-up time, reverse the line plug in the power outlet.

Range: Model E-510 covers the broadcast band from 540 to 1600 kilocycles. Since the scale is calibrated 54 to 160, the actual frequency of the station received is obtained by adding a zero to the dial calibration.

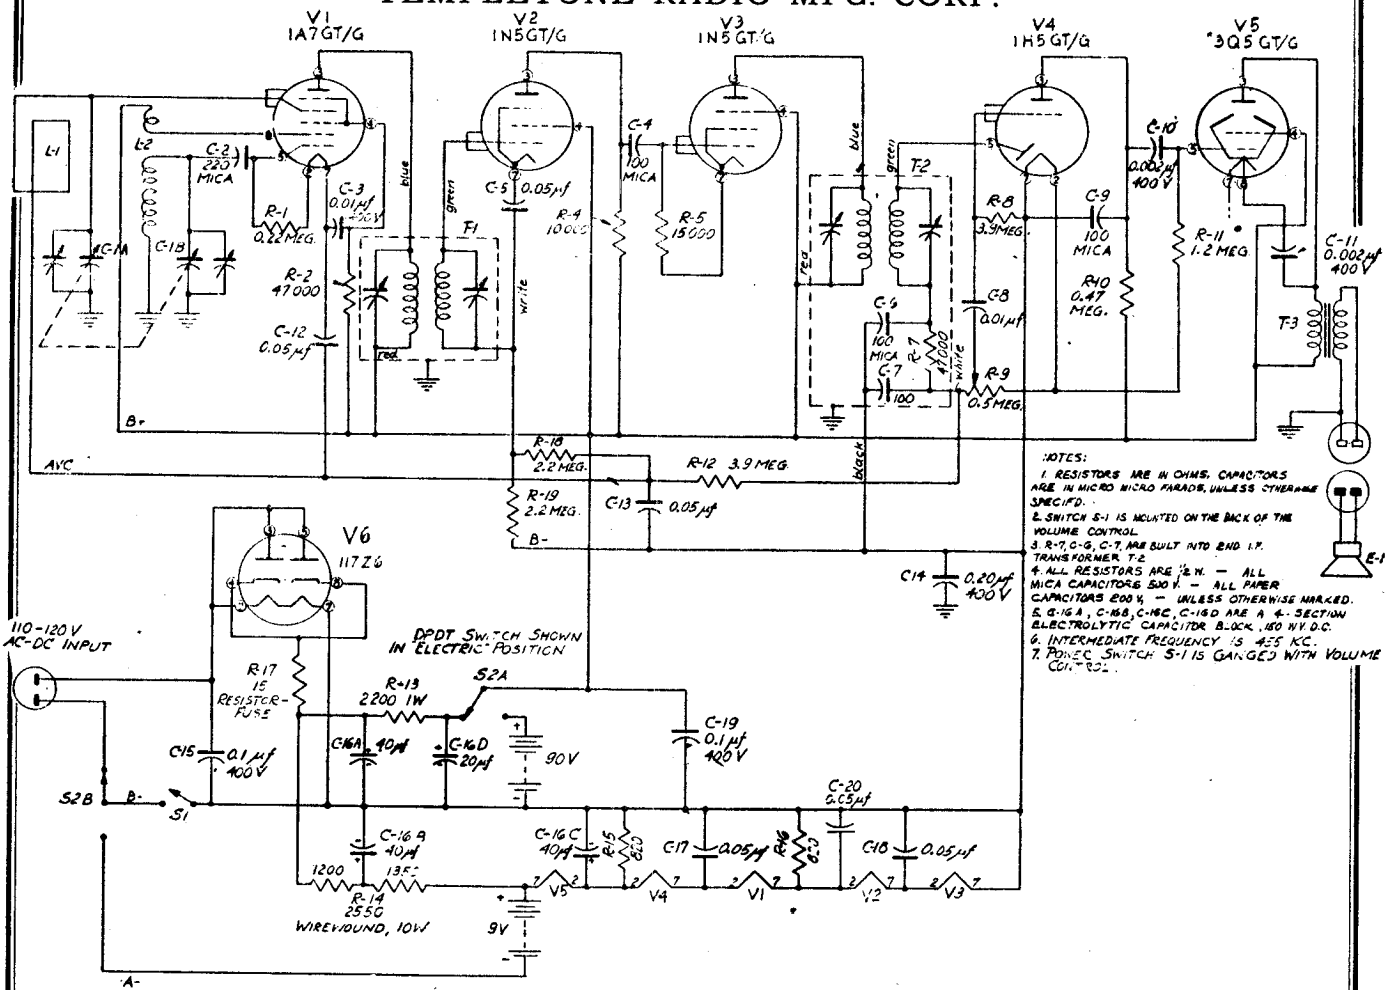
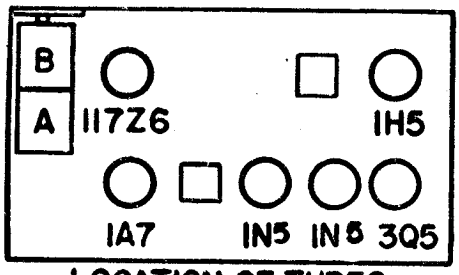
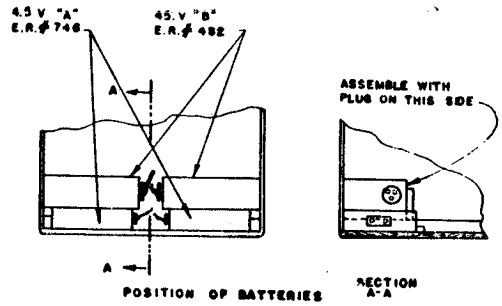
MODEL F-611

TEMPLETONE RADIO MFG. CORP.





LOCATION OF TUBES



Alignment: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception.

The Signal Generator may be connected through a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section A of tuning capacitor. Connect ground clip of generator to a convenient B-minus point (such as the case of the electrolytic capacitor, or one of the switch terminals on the back of the volume control). An output meter may be clipped directly across the voice coil lugs. Align the I.F. trimmers to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad.

To align RF trimmers, remove the 0.01 mf capacitor and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and pointer at extreme right end of travel, adjust the oscillator trimmer (B) (on front section of tuning capacitor) to 1700 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (A) (on rear section) for maximum response.

ALIGNMENT AND SERVICE DATA

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the metal frame of the gang condenser. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the front of the chassis between the volume and tuning controls. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

Remove the chassis from the cabinet for alignment.

A signal generator is required, having the following frequencies: 455 KC, 1400 KC, 1730 KC. An output meter should be connected across the speaker.

I. F. ALIGNMENT: — Connect the generator lead through a .1 MFD Condenser to the terminal lug on the "Antenna" section of the gang condenser. The ground lead from the generator should be connected to the gang frame. Set the generator at 455 KC. Adjust the trimmer screws in the 1st and 2nd I. F. cans (See Fig. 1) until a maximum reading is noted on the output meter.

The receiver volume control should be turned to maximum during the I. F. and all subsequent alignments, to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

BC. OR BROADCAST ALIGNMENT: — With the generator leads still connected as in I. F. Alignment, rotate the tuning condenser to complete minimum capacity. Set the generator to 1730 KC. Adjust the BC. oscillator trimmer until the signal is tuned in. Next remove the hot lead of the generator from the "Ant" section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Set the generator to 1400 KC and rotate the tuning condenser until the signal is tuned in. Adjust the BC. antenna trimmer until a maximum reading is noted on the output meter. Set the generator to 600 KC and turn the tuning control until the signal is tuned in. Rock the tuning control back and forth slowly and at the same time adjust the 600 KC pad, slowly to the right or left until a maximum reading is noted on the output meter. It is advisable to return to the 1730 KC adjustment and re-check that setting to make sure it has not changed while padding at 600 KC.

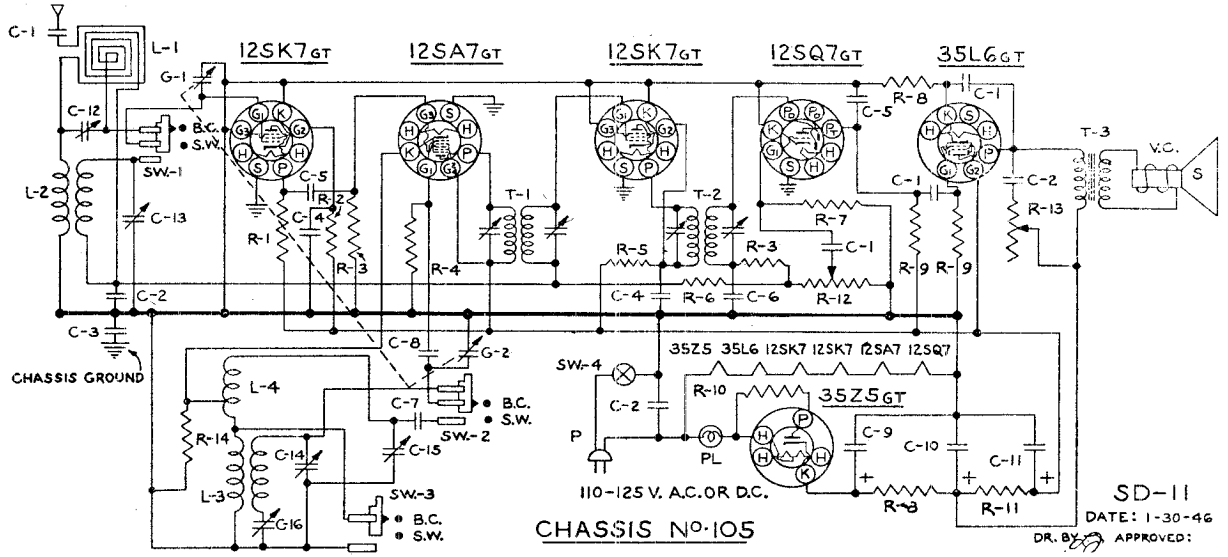
MODELS 5010, 5011, 5012
Chassis 105

TRAV-LER RADIO CORP.



Remove the chassis from the cabinet for alignment.

A signal generator is required, having the following frequencies: 455 KC, 1400 KC, 1730 KC. 6 MC, 16 MC, and 18.3 MC. An output meter should be connected across the speaker.

I. F. ALIGNMENT: — Connect the generator lead through a .1 MFD Condenser to the terminal lug on the "Antenna" section of the gang condenser. The ground lead from the generator should be connected to the gang frame. Set the generator at 455 KC. Adjust the trimmer screws in the 1st and 2nd I. F. cans (See Fig. 1) until a maximum reading is noted on the output meter.

The receiver volume control should be turned to maximum during the **I. F.** and all subsequent alignments, to keep the AVC from working and giving false readings. Keep the generator output as low as possible to prevent overloading.

BC. OR BROADCAST ALIGNMENT: — With the generator leads still connected as in I. F. Alignment, rotate the tuning condenser to complete minimum capacity. Set the generator to 1730 KC. Adjust the BC. oscillator trimmer until the signal is tuned in. Next remove the hot lead of the generator from the "Ant" section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Set the generator to 1400 KC and rotate the tuning condenser until the signal is tuned in. Adjust the BC. antenna trimmer until a maximum reading is noted on the output meter. Set the generator to 600 KC and turn the tuning control until the signal is tuned in. Rock the tuning control back and forth slowly and at the same time adjust the 600 KC pad, slowly to the right or left until a maximum reading is noted on the output meter. It is advisable to return to the 1730 KC adjustment and re-check that setting to make sure it has not changed while padding at 600 KC.

S. W. OR SHORT WAVE ALIGNMENT: — Set the generator at 18.3 MC. Turn the receiver band switch to short band position. Turn the tuning condenser to complete minimum capacity. The generator leads should be connected to the antenna lead wire that projects from the back of the loop antenna through a 400 Ohm resistor. Adjust the S. W. oscillator trimmer slowly until the 18.3 MC signal is tuned in. At this point, it will be well to make sure that the fundamental signal is turned in. Turn up the generator output and tune the receiver to approximately 17.3 MC. At this point the 18.3 MC signal will be heard again but much weaker. This is the image frequency. If the image is not heard, then turn the tuning condenser back to complete minimum and readjust the S. W. oscillator trimmer. Remember, the image must always be heard (at 2 times the I. F. frequency in KC) lower the frequency than the fundamental signal. After the oscillator has been properly set, tune the signal generator to 16 MC and rotate the tuning control until the signal is tuned in. Adjust the S.W. antenna trimmer until a maximum reading is noted on the output meter. It is advisable to rock the gang slowly while adjusting the antenna trimmer. Set the generator to 6 MC and tune the signal in on the receiver. Check the alignment at this frequency. No adjustment should be necessary as the coils have been carefully checked before leaving the factory. A fixed oscillator padding condenser is used at 6 MC.

Remove chassis from cabinet for alignment.

A Signal Generator is required having the following frequencies: 455 KC, 1400 KC, 1720 KC. An output meter should be connected across the speaker.

FIRST STEP: Connect the hot lead from the generator to the ANT. section of the gang condenser, through a .1 MFD condenser. The ground lead from the generator must be connected to the metal frame of the gang condenser. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator still connected in the same manner, adjust the Signal Generator to 1720 KC. The OSC. trimmer is located on the top of the oscillator section of the gang condenser. Adjust this trimmer until the 1720 KC signal is tuned in.

THIRD STEP: Remove the hot lead of the generator from the ANT section of the gang condenser. Connect this lead to the antenna lead wire that projects from the back of the loop antenna through a 200 MMFD condenser. Adjust the Signal Generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The ANT trimmer is located on the back of the loop antenna. Adjust this trimmer until a maximum reading is noted on the output meter. No further adjustment should be necessary, unless the set has been damaged, as the coils and condenser in this receiver have been specially handled at the factory to insure proper alignment at the lower frequencies.

ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd. — 200 mmf. — 400 ohms

CONNECT TEST OSCILLATOR TO	DUMMY ANTENNA	INPUT SIGNAL FREQUENCY	BAND	SET DIAL AT	TRIMMERS	PURPOSE
12SA7GT grid	.1 mfd.	455 kc.	Broadcast	HF end	C D E F	Align IF
12SA7GT grid	.1 mfd.	1620 kc.	Broadcast	HF end	B	Set limit of band
Ant. terminal	400 ohms	18.3 mc.	Short Wave	HF end	C-9	Set limit of band
Ant. terminal	400 ohms	18.0 mc.	Short Wave	18 mc.	C-2	Align antenna
Ant. terminal	200 mmf.	1400 kc.	Broadcast	1400 kc.	C-3	Align antenna
Ant. terminal	200 mmf.	600 kc.	Broadcast	600 kc.	C-6	Rock gang and adjust to max.

NOTE: Recheck alignment of trimmers B and C-3 after adjusting C-6.

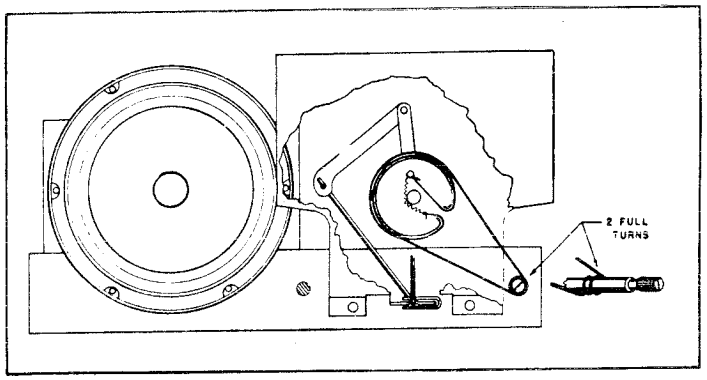
ALIGNMENT PROCEDURE

The following equipment is necessary to properly align this chassis:

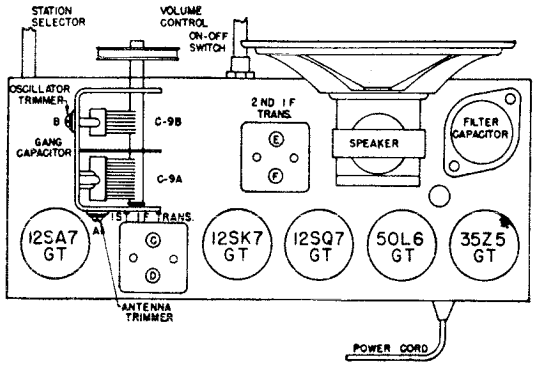
1. A signal generator which will provide an accurately calibrated signal at the frequencies listed.
2. An output meter.
3. A non-metallic screwdriver.
4. Dummy antenna: — .1 mfd., — RMA loop.

NOTE: Intermediate Frequency and Oscillator adjustments may be made with the loop disconnected provided a resistor of 10,000 to 50,000 ohms is substituted to close the 12SA7GT grid circuit. The loop alignment must be done with the loop and chassis mounted in operating position in the cabinet. A single turn loosely coupled to loop may be substituted for RMA loop.

GENERATOR	CONNECTION AT RADIO	DUMMY ANTENNA	DIAL	TO TUNE TRIMMERS	REMARKS
1F 455 kc.	12SA7GT grid	.1 mfd.	HF end	1F trimmers C D E F	Tune to max.
1620 kc.	Through loop	RMA loop	HF end	Osc. trimmer B	Set limit of band
1400 kc.	Through loop	RMA loop	1400 kc.	Ant. trimmer A	Tune to max.



Dial Mechanism



Tube Layout

Electrical and Mechanical Specifications

Frequency Range ..... 540-1600 kc.
Intermediate Frequency ..... 455 kc.
Power Supply ..... 105-125 volts AC-DC
Loudspeaker ..... Dynamic
V.C. Impedance ..... 3.5 ohms at 400 cycles
Power Output (Undistorted) ..... .75 watts
Power Output (Maximum) ..... 1.5 watts
Tuning Drive Ratio ..... 3 to 1

ALIGNMENT PROCEDURE

CAUTION: This is an A.C./D. C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

Connect the Signal Generator through a .1 MFD. condenser to the variable condenser side of the loop. Connect the ground side of the Signal Generator to the chassis. Adjust the Signal Generator to 455 Kilocycles and set the variable condenser of the receiver to minimum capacity (fully opened). With volume control full on and minimum output from the Signal Generator adjust the two trimmers on top of the 1st and 2nd I.F. transformers (T3-T4) for maximum output. Now connect the Signal Generator through a .00025 condenser to the external antenna connection on the back of the loop. Connect ground side of Signal Generator to terminal marked "G" on back of loop. Adjust frequency to 1630 K. C., set variable condenser at minimum capacity (fully opened) and adjust the oscillator trimmer (C11) for maximum output. Set Signal Generator to 1400 K.C., tune receiver to signal and adjust the Antenna trimmer (C12) on top of the variable condenser for maximum output.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, to prevent A.V.C. action from interfering with correct alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat alignment procedure given below as a final check.

CAUTION: This is an A.C.-D.C. receiver and when aligning the set it is necessary to isolate the Signal Generator or the Receiver from the line by use of a transformer, or place a .2 MFD. condenser in both test leads of the Signal Generator.

With an output meter connected across the voice coil of the speaker, the output meter reading for ½ watt is 1.25 volts using a signal which is modulated 400 c.p.s. Follow through the procedure as outlined below for proper alignment.

The alignment should be made with volume control fully on, and the output from the signal generator as low as possible, for accurate alignment.

Position of Variable	Generator Freq.	Dummy Ant. mfd.	Generator Connections	Trimmer Adjustment	Trimmer Function
Fully Open	455 KC	.1	6SA7 Grid (Stator of C1B)	T1 T2	I. F.
Fully Open	1725 KC	.00025	*Ant. Terminal on Loop	C1C	Osc.
Tune in signal from Generator	1500 KC	.00025	*Ant. Terminal on Loop	C1B	R. F.
Tune in signal from Generator	1500 KC	.00025	*Ant. Terminal on Loop	C1A	Ant.

* Be sure coupling link is in correct position for external antenna operation. See illustration below.

Repeat the above alignment procedure as a final check.

For Parts list, see P.15-5

ALIGNMENT PROCEDURE

With an output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is .4 volts using a signal which is modulated 30% at 400 c.p.s. Follow through the procedure as outlined below for proper alignment.

Connect the signal generator to the grid cap of the 1A7 GT Tube through a .1 MFD. Condenser. Connect the ground lead of the generator to the chassis. Adjust the signal generator to 455 K.C. and set the variable condenser of the receiver to minimum capacity (fully opened). With the volume control full on and minimum output from the signal generator adjust the two trimmers on top of the first and second I.F. transformers for maximum output.

Now connect the signal generator to the antenna connection of the receiver through a .00025 condenser. Adjust the signal generator frequency to 1725 K. C. and set the variable condenser to minimum capacity (fully opened), and adjust the oscillator trimmer (C1B) for maximum output. Set signal generator to 1500 K. C. and tune receiver to signal. Adjust the antenna trimmer (C1A) on the variable condenser for maximum output.

ALIGNMENT PROCEDURE

I.F. ALIGNMENT – SWING THE VARIABLE CONDENSER TO MINIMUM CAPACITY POSITION. FEED 455 K.C. SIGNAL TO GRID OF 12SA7 TUBE THRU .1 MFD. CONDENSER AND ADJUST FOUR I.F. TRIMMERS FOR MAXIMUM RESPONSE.

R.F. ALIGNMENT – SET DIAL POINTER TO 1400 K.C. ON DIAL. SET SIGNAL GENERATOR TO 1400 K.C. FEEDING OUTPUT INTO STANDARD RADIATING LOOP. ADJUST HIGH FREQUENCY TRIMMER FOR MAXIMUM OUTPUT THEN ADJUST ANT. TRIMMER LOCATED ON RECEIVER LOOP FOR MAXIMUM OUTPUT.

SET SIGNAL GENERATOR TO 600 K.C. AND WHILE ROCKING GANG, ADJUST LOW FREQUENCY TRIMMER FOR MAXIMUM OUTPUT. RETURN TO 1400 K.C. AND REPEAT HIGH FREQUENCY ADJUSTMENT.

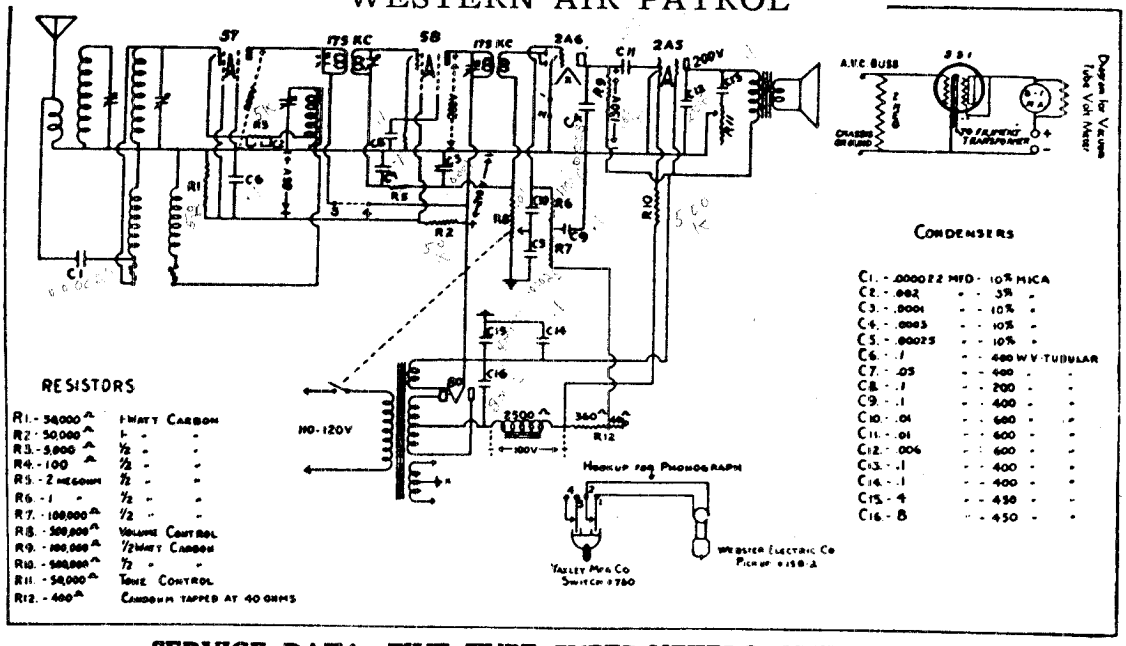
MODEL 5-Tube
Super. '34-'35

WESTERN AIR PATROL



SERVICE DATA, FIVE TUBE SUPER-HETERODYNE, 1934-1935

All models have automatic volume control of the diode type, controlling the first detector as well as the high frequency amplifier tubes. This A.V.C. makes it impossible to service and rebalance without a meter of the type to be described. This meter will work on any make or type of A.V.C., provided care is used. It can not be damaged by improper connection of the leads.

PARTS REQUIRED FOR VACUUM TUBE VOLT METER

1—0 to 1 or 0 to 1.5 milliampmeter.
1—Bell ringing transformer with secondary of 6-10 volts.
1—5 prong socket.
1—551 tube.
1—2 megohn grid leak.
1—10 ohm rheostat.
1—45 volt B battery.
Clips, Box, Cord, Hookup Wire.

USING VACUUM TUBE VOLT METER

The cathode clip is connected to the cathodes of the tubes controlled by the A.V.C. The buss clip is connected to the A.V.C. buss in front of the isolating resistor.

Adjust rheostat shunt until meter shows full scale reading.

All balancing is done with maximum peak indicated by the meter swing toward O. Sensitivity of various receivers can be checked by the swing of meter from a known station. Short Wave fading can be seen by tuning in the station with meter connected to set.

REBALANCING

Do not rebalance a set until you are sure it requires it. 99 per cent of the sets do not need it. We do not find one case in one hundred that really should be rebalanced.

INTERMEDIATES

Connect a 175 K.C. oscillator to the first detector grid (No. 57 tube) leaving grid cap in place. Set dial at 1400 K.C. Hook up vacuum tube volt meter as described and carefully adjust 3 screws on top of Intermediates for maximum gain (minimum reading of meter). Don't flat top any stages. Have all shields in place. Keep volume control at lowest level.

CONDENSER GANG

Set dial at 1400 K.C. when gang is at minimum position and tighten dial set screws. Tune in a station (or use an oscillator) to a known frequency signal around 1400 K.C. Carefully adjust oscillator section of gang until frequency is correct on dial.

If the intermediates are balanced on 175 K.C., the dial will now track within 5 K.C. over the entire dial.

Adjust first detector section for maximum gain and follow by adjusting band pass trimmers.

Don't bend any condenser plates unless absolutely necessary.

OVERLOADING—OR POOR QUALITY AT LOW VOLUME

The chief cause of this trouble is too long an antenna. A powerful local station will cause the R. F. tubes to block. Check this by disconnecting the antenna on the station causing the trouble. If too close to a powerful station, installing a switch in the aerial circuit helps this. In rare cases the set seems to overload and the A.V.C. works too quickly on all stations.

Check the following:

Disconnect 2 meg. resistor from A.V.C. buss at tie point. Have all tubes cold. Use high voltage, high resistance ohmmeter capable of reading 25 megohms and test from ground to A.V.C. buss for leakage. After condensers have charged, no leakage should be shown. This must read around 100 megohms to ground.

If slight leakage is observed, disconnect bypass condensers from buss until defective one is found. Sometimes moisture is found on coil terminals. Scrape this clear.

NOISY OPERATION (Not Static)

A defective tube will cause a sharp 60 cycle R.F. pickup. This is most prominent on low frequency. Replace with a good tube.

In many cases it is found that the noise cannot be eliminated by servicing the receiver. Noise may enter into the light lines or via the antenna. The only way to check the source is to turn off one after another all electrical apparatus in the vicinity of the set.

There is no freak or trick antenna that will eliminate natural static.

GENERAL

All resistors, bypass condensers and filter units are marked.

Voltages are shown at tube socket on diagram.

99 per cent of trouble in a chassis is caused by defective tubes, check them carefully.

WESTERN AUTO SUPPLY CO.

MODEL D1645

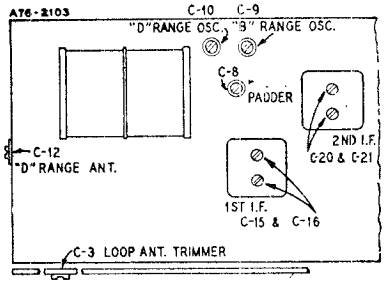
ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter—Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR FREQUENCY SETTING	SIGNAL GENERATOR CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	455 KC	Grid of 6SA7 Pin 8	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C15) & (C16) 2nd I.F. (C20) & (C21)
RANGE B	1620 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Ant. Range B (C3)
	600 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output	Oscillator (C8) See Note B
	Repeat above steps at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C8) causes no further improvement of output.					
RANGE D	15,600 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	15,600 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Ant. Range D (C2)
LOOP RANGE B	Reassemble chassis in cabinet. 1400 KC	Antenna Lead	100 mmf.	B Range	Tune Rotor to Max. Output See Note A	Ant. Range B (C3)

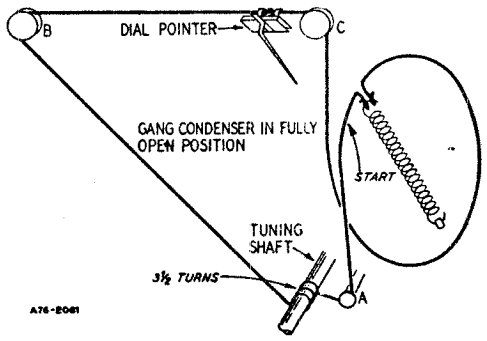


NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn rotor back and forth and adjust the trimmer until peak of greatest intensity is obtained.

DRIVE CORD REPLACEMENT

The drive cord should be replaced as shown on the accompanying illustration using a 50" drive cord for the purpose. After the cord has been installed, stretch the tension spring and tie the free end of the cord to it, then cut off any excess string that may remain.



Before removing the chassis from the cabinet it will be necessary to detach the dial pointer from the dial string. To do this, spread the tabs on the pointer and pull the dial string off the pointer.

The dial lamp socket assemblies may be disengaged from the cabinet mounting by squeezing together and pulling away from the cabinet mounting, the spring bracket to which the dial lamp socket is mounted. Take care not to bend or damage the large drive pulley on the gang condenser while doing this.

When replacing the chassis in the cabinet it will be necessary to tune in a station of a known frequency and move the dial pointer until that frequency is indicated on the dial and then attach the pointer to the dial string. Take care not to scuff or cut the dial string or bend the pointer during this operation.

MODELS D2610, D2611

REPLACEMENT PARTS LIST

When ordering parts mention part number, model number, and series

Schematic Diagram Symbol	Part No.	Description
		CONDENSERS
C1		See "Antenna plate" under "Miscellaneous"

		COILS
T1, T2	112827	Tuning assembly, complete (consists of antenna and oscillator coils)
T3	108157J	Input I.F. coil, complete in can
T4	108157K	Output I.F. coil, complete in can

*The values of all resistors listed above are based on RMA standards. Due to conditions beyond our control some receivers have been shipped with resistors of pre-standardized values. This receiver will operate equally well with resistors of either group. An illustration of the difference follows:

Pre-standardized value—50,000 ohms, ±10%, 1/3 watt
RMA value—47,000 ohms, ±10%, 1/2 watt

NOTE ON TUBE REPLACEMENT

Replace a defective metal 125K7 tube with another metal tube. Replace a glass 12SK7 tube with either a metal tube or with an exact duplicate of the tube now in the set.

		DIAL PARTS
	112822	Dial scale

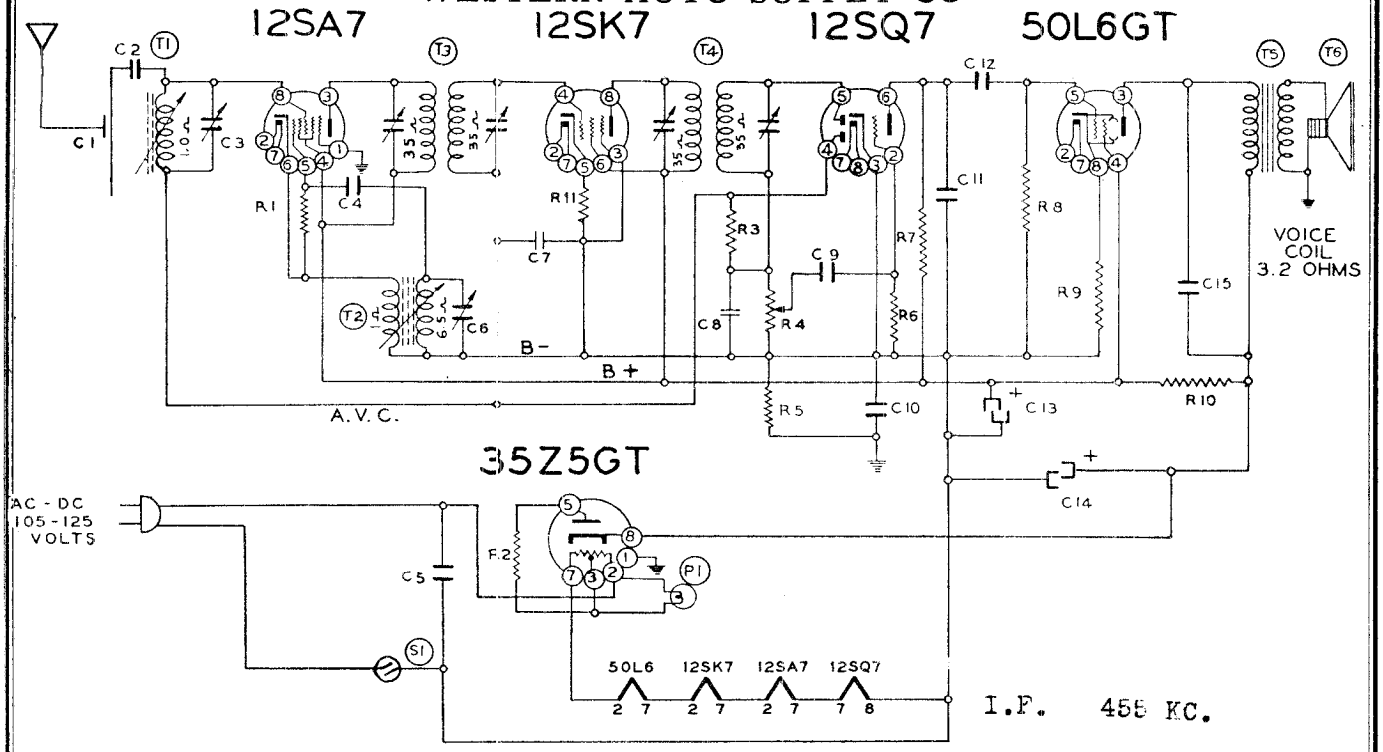
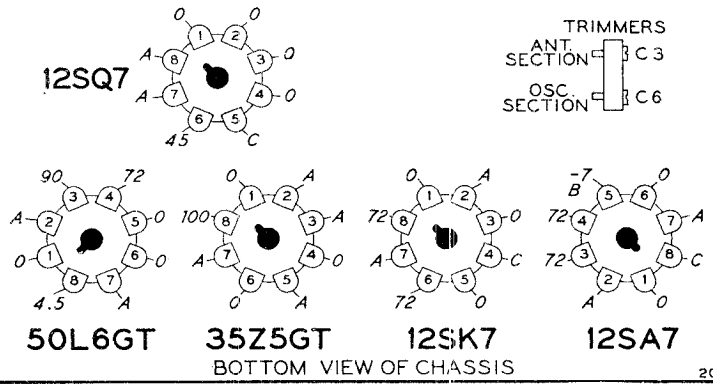
WESTERN AUTO SUPPLY CO



NOTES - VOLTAGES MEASURED WITH A 1000-OHM-PER-VOLT VOLTMETER BETWEEN SOCKET TERMINALS AND NEGATIVE B SUPPLY.
A - CANNOT BE MEASURED WITH VOLTMETER.
B - OSCILLATOR VOLTAGE MEASURED WITH R.F. CHOKE IN SERIES WITH VOLTMETER LEAD.
C - DIODE VOLTAGE, LESS THAN ONE VOLT NEGATIVE, CANNOT BE MEASURED ACCURATELY.



Voltages at tube sockets

Technical Data

Tuning Range	535 to 1720 kc.
Intermediate Freq.	455 kc.
Power Consumption	35 watts
Sensitivity (for 0.05 watt output)	60 microvolts average
Selectivity	80 kc. at 1000 times signal at 1000 kc.
Power Output(in voice coil)	
Undistorted	0.8 watt
Maximum	1.2 watt

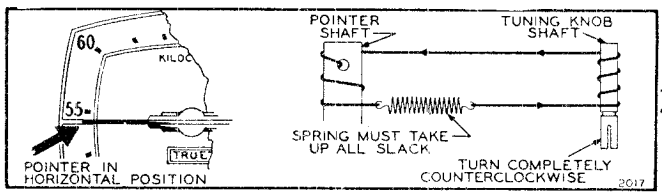
REPLACING DIAL STRING (See Illustration)

1. Rotate the tuning shaft to its extreme counter-clockwise position (rotors completely closed).

2. Tie one end of the string to the tension spring. Wind the string around the pointer shaft, passing it through the hole, and around the tuning knob shaft as shown. The direction of winding and the number of turns must be exactly as illustrated. IMPORTANT: When the installation is complete, and when the condenser rotors are closed, the spring should be close to the pointer shaft.

3. Tie the other end of the string to the spring, first stretching the spring so that it will take up all slack.

4. Remove the crystal covering the face of the dial. Rotate the pointer, against the friction of the shaft, until it is in a horizontal position, as illustrated.



Dial string replacement

For Parts list, see P.15-4

©John F. Rider

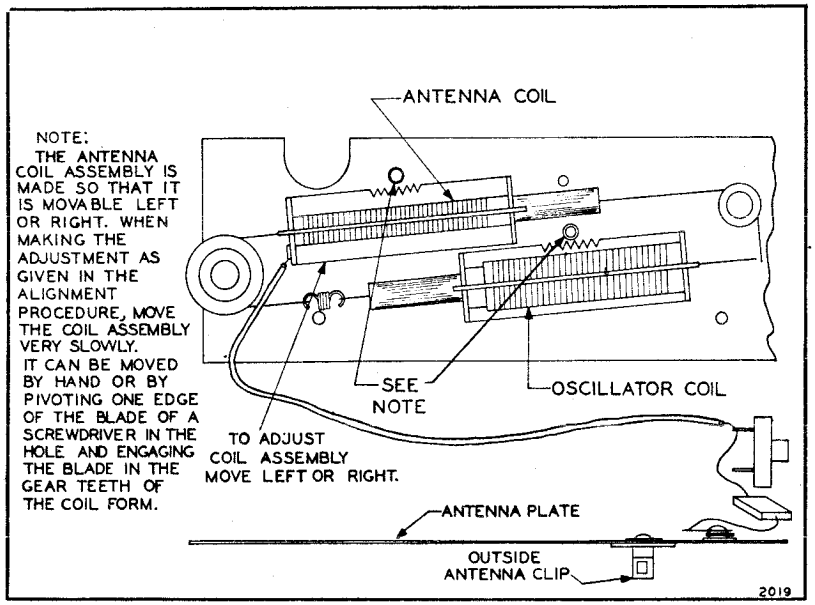
ALIGNMENT PROCEDURE

- No aligning adjustments should be attempted until all other possible causes of trouble have been checked.
- Turn volume control to maximum for all adjustments.
- Connect ground post of signal generator to B— of radio through a 0.1 mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.

Band	Signal Generator Frequency Setting	Dummy Antenna	Connection to Radio	Position of Iron Cores (Dial Setting)	Trimmers Adjusted (in order shown)	Adjustment
I.F.	455 Kc.	.1 mfd.	Grid of 12SA7	All the way out	Two trimmers on top of output I.F. can	Adjust for maximum output
	455 Kc.	.1 mfd.	Grid of 12SA7	All the way out	Two trimmers on top of input I.F. can	Adjust for maximum output
BROADCAST	1720 Kc.	.1 mfd.	Grid of 12SA7	All the way out	Oscillator trimmer C6 (see chassis view, page 2)	Adjust for maximum output
	1720 Kc.	200 mmf.	Outside Antenna Clip	All the way out	Antenna trimmer C3 (see chassis view, page 2)	Adjust for maximum output
	1400 Kc.	200 mmf.	Outside Antenna Clip	Turn dial to 1400 Kc.	Adjust position of antenna coil	Adjust for maximum output (see coil view below)
	1720 Kc.	200 mmf.	Outside Antenna Clip	Turn dial to 1720 Kc.	Antenna trimmer C3 (see chassis view, page 2)	Check for tracking (see note below)

NOTE: After the antenna coil has been tracked at 1400 Kc. it is necessary to check the adjustment of antenna trimmer C3 again at 1720 Kc. If no appreciable change in trimmer adjustment is necessary, the coil is in track. If the trimmer requires considerable adjustment, it will be necessary again to adjust the position of the antenna coil at 1400 Kc. These two adjustments should be made several times, until no change of trimmer adjustment is required at 1720 Kc.



NOTE:
THE ANTENNA COIL ASSEMBLY IS MADE SO THAT IT IS MOVABLE LEFT OR RIGHT. WHEN MAKING THE ADJUSTMENT AS GIVEN IN THE ALIGNMENT PROCEDURE, MOVE THE COIL ASSEMBLY VERY SLOWLY. IT CAN BE MOVED BY HAND OR BY PIVOTING ONE EDGE OF THE BLADE OF A SCREWDRIVER IN THE HOLE AND ENGAGING THE BLADE IN THE GEAR TEETH OF THE COIL FORM.
ANTENNA COIL
SEE NOTE

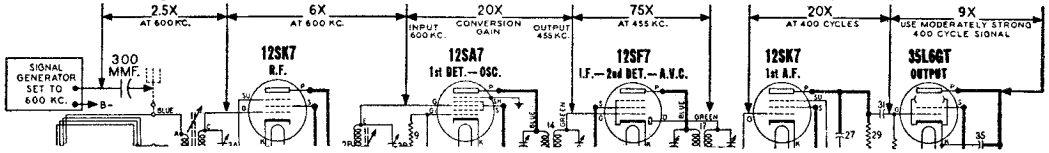
APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point.
   IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

MODEL D2612

WESTERN AUTO SUPPLY CO.

ALIGNMENT PROCEDURE

1. Remove chassis and loop from cabinet. Solder approximately 8" of insulated wire to any B— connection (see voltage chart on opposite side for convenient B— location). Then reinstall chassis and loop in cabinet. The B— lead should extend from under the chassis at the back.
2. Connect ground lead of signal generator to B— lead.
3. Connect output meter across the speaker voice coil (terminals at back of speaker.)
4. Turn the tuning control knob clockwise as far as it will go (tuner mechanism is now in maximum open position with tuning slugs almost completely withdrawn from coils). Dial pointer should then point to 1600 Kc mark on scale. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
Set tuner mechanism to maximum open position by turning the tuning control knob clockwise as far as it will go (Dial pointer at 1600 Kc). Then check whether the positions of the tuning slugs correspond to the positions shown in Fig. 1 below. If settings are incorrect, rotate the individual core and threaded stem until desired position is reached. Note that threaded stem is prevented from moving by a dab of speaker cement at top.						
.1 MFD. Condenser	Ungrounded terminal of trimmer No. 6 (see Fig. 2 below for location of trimmer.)	455 KC	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
				3-4	1st I.F.

300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
				7	Broadcast Antenna	Adjust for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1400 KC	Tune to 1400 KC generator signal	Ant. coil tuning slug		Adjust position of slug for maximum output.
				R.F. coil tuning slug		Adjust position of slug for maximum output.
300 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1600 KC	Tune to 1600 KC generator signal	6	Broadcast R.F.	Recheck adjustment for maximum output.
				7	Broadcast Antenna	Recheck adjustment for maximum output.
Apply a coating of speaker cement at top of each tuning core stem to prevent movement.						

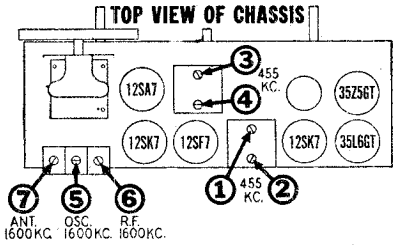

FIG. 2

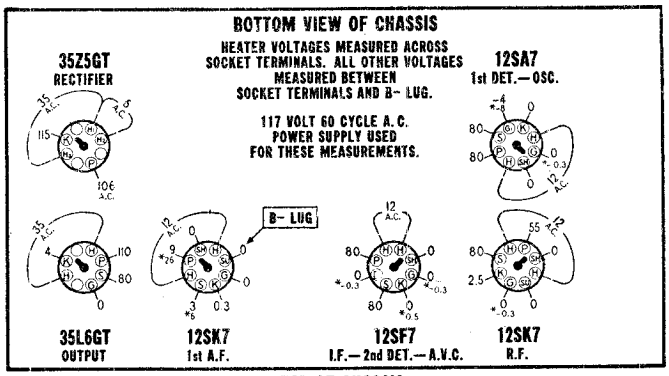
AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and, should it ever be necessary to replace the speaker or output transformer, it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the secondary of the output transformer.

SOCKET VOLTAGES

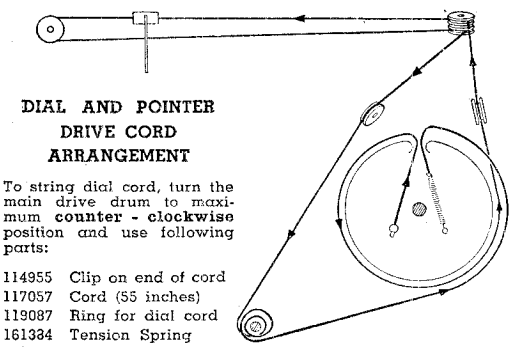
Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

VOLUME ON FULL WITH NO SIGNAL DIAL TUNED TO 540 KC.



REAR OF CHASSIS

*—Measured with vacuum tube voltmeter



DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, turn the main drive drum to maximum **counter - clockwise** position and use following parts:

114955	Clip on end of cord
117057	Cord (55 inches)
119087	Ring for dial cord
161334	Tension Spring

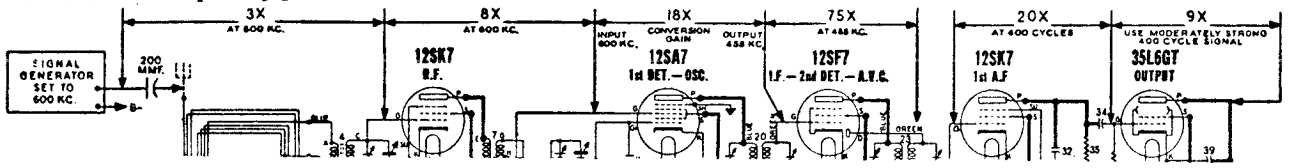
APPROXIMATE STAGE GAIN DATA

Be sure R.F. and I.F. stages are accurately aligned before measuring gain. R.F. gains can be measured with a "channel" type instrument containing a tuned and calibrated R.F. amplifier. A vacuum tube voltmeter may be used for audio gain measurements. Observe following precautions:

1. For all gain measurements connect signal generator as shown. Use 600 KC. signal with 400 cycle modulation (use nearby frequency if local station interferes.)
2. For R.F. and I.F. measurements connect negative terminal of a 3 volt battery (two 1½ volt cells in series) to A.V.C. lead and positive terminal to B—. This provides a definite operating point. IMPORTANT: Disconnect battery when measuring audio stage gains.
3. Be sure radio is carefully tuned to generator signal (use weak signal for sharp tuning.)
4. When using a "channel" type instrument carefully tune it for maximum output at desired frequency before making measurements.

The R.F. and I.F. stage gains shown below are less than under normal operating conditions due to the use of 3 volts fixed bias in order to establish a definite operating point. Therefore, these values are not intended to indicate the full capability of a stage.



Differences in tube characteristics, tolerance of parts, adjustment of tuned circuits, and variations of line voltage will influence stage gain. Accuracy of measurements is dependent upon careful tuning of receiver to generator signal and experience in using your test equipment. These factors may create considerable variation in gain measurements.

Lettered terminals in illustrations correspond to similarly lettered terminals on the circuit diagram.

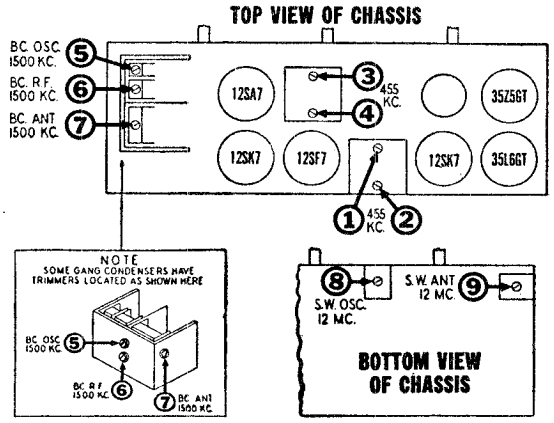
MODEL D2613

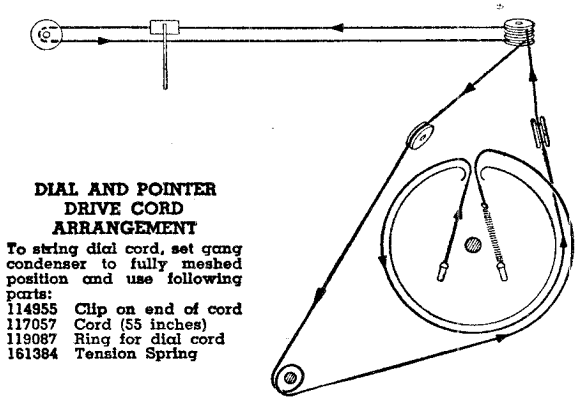
WESTERN AUTO SUPPLY CO.
ALIGNMENT PROCEDURE

1. **Remove chassis and loop antenna from cabinet. Reconnect loop to chassis and space it approximately same distance from chassis as when installed in cabinet.**
2. Note that there are four calibrating lines stamped into the metal dial frame. When gang condenser is fully meshed, dial pointer should be in the position indicated by first line at the left. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
3. Connect an output meter across the speaker voice coil or from plate of 35L6GT tube to B— through a .1 Mfd. condenser (see voltage chart for convenient B— connection).
4. Connect ground lead from signal generator to B— through a .25 Mfd. condenser.
5. Set volume control at maximum volume position and use a weak signal from the signal generator.

IMPORTANT:—Align this receiver in exactly the order shown below. Broadcast band must be aligned before short wave band.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Control Grid of 12SA7	455 KC	Broadcast	Any point where it does not affect the signal	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Set pointer to 1500 KC reference line stamped into metal dial plate (first line at the right)	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	6	Broadcast R.F.	Adjust for maximum output.
200 MMFD. Mica Condenser	External Antenna Clip on Loop Frame	1500 KC	Broadcast	Tune to 1500 KC generator signal	7	Broadcast Antenna	Adjust for maximum output.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Set pointer to 12 MC. Reference line stamped into metal dial plate (second line from the right)	8	Short Wave Oscillator	Adjust to bring in signal. Check to see if proper peak was obtained by tuning in image at approx. 11.1 MC. If image does not appear, realign at 12 MC. with trimmer screw farther out. Recheck image.
400 OHM Resistor	External Antenna Clip on Loop Frame	12 MC	Short Wave	Tune to 12 MC generator signal	9	Short Wave Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.





DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

114955 Clip on end of cord
117057 Cord (55 inches)
119087 Ring for dial cord
161384 Tension Spring

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*).

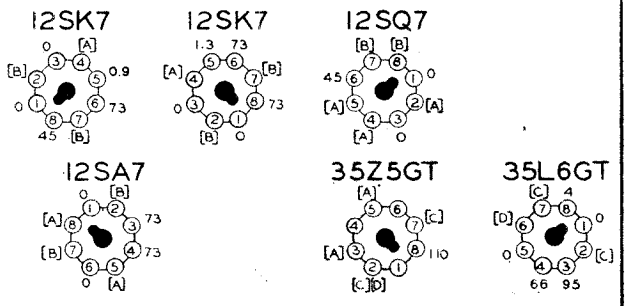
[D] 117 VOLTS A.C. BETWEEN PINS MARKED D



Voltages at tube socket terminals

IMPORTANT!

This receiver, unless otherwise marked, must be operated on an AC voltage of 105 to 125 volts, 50 to 60 cycles, or on a DC voltage of 105 to 125 volts. If you are in doubt as to the voltage of your power supply, consult your local power company. DO NOT INSERT THE PLUG IN THE POWER RECEPTACLE UNLESS YOU ARE SURE THAT THE CORRECT VOLTAGE IS AVAILABLE. Receivers of this same model which are for use on voltages other than those specified above are so marked.

SETTING THE PUSHBUTTONS

The pushbuttons may be used, after proper adjustment, for the automatic tuning of any six stations which you select. They can be set up in any order.

1. Turn on the radio. Allow it to warm up for at least one minute.
2. Push out the call letters of the six stations from the call-letter sheets supplied with this manual.
3. Insert one call-letter tab in the rectangular opening in each of the pushbuttons, in any sequence. Press an acetate tab (supplied in small envelope) into each of the pushbuttons.
4. Check to see that the locking screw in the center of the tuning knob (see illustration) is loose. If it is not, turn it several turns to the left (counterclockwise). A coin may be used for this purpose.
5. Press the first pushbutton down all the way. With one hand hold the button down firmly and with the other carefully tune in the desired station. Release the pushbutton.
6. Follow this procedure for each of the five other buttons, adjusting each one for a different station.
7. Rotate the tuning knob on the side of the cabinet as far to the right as it will go. Tighten the locking screw in the center of the knob. IT IS IMPORTANT THAT THIS SCREW BE TIGHTENED VERY FIRMLY.
8. The pushbuttons are now properly set for automatic tuning. Any of the six stations may now be tuned in simply by pressing the proper button down as far as it will go. If it is desired to reset any of the buttons for a new station, loosen the locking screw in the center of the tuning knob, set the pushbutton as described above, and re-tighten the locking screw.

Power consumption ..... 35 watts
Selectivity ..... 55 Kc. broad at 1000 times signal at 1000 Kc.

MODEL D2615

WESTERN AUTO SUPPLY CO.
LIST OF REPLACEMENT PARTS

When ordering parts specify part number, model number, and series
Use Only Genuine Factory Replacement Parts

NOTE ON TUBE REPLACEMENT

Replace a defective metal 12SK7 tube with another metal tube. Replace a glass 12SK7 tube with either a metal tube or with an exact duplicate of the tube now in the set.

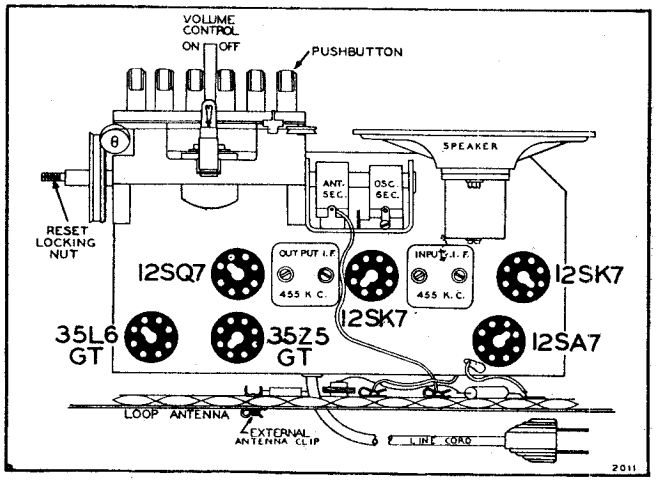
We cannot supply speaker cones or fields separately. We can replace or repair a damaged speaker if it is returned to our factory, transportation charges prepaid.



Top view of chassis

ALIGNMENT PROCEDURE

- No aligning adjustments should be attempted until all other possible causes of trouble have been checked.
- Chassis must be removed from cabinet for proper alignment. Slight adjustments of the oscillator and antenna circuits can be made, without removing the chassis, through two holes provided on the bottom of the cabinet. The two adjustment screws can be reached with a long insulated screwdriver.
- It is important that during alignment the loop antenna be maintained at the same distance from the chassis as when the chassis is installed in the cabinet.
- Turn volume control to maximum for all adjustments.
- Connect ground post of signal generator to B— of radio through a 0.1 mfd. condenser.
- Connect dummy antenna value in series with generator output lead.
- Connect output meter across primary of output transformer.

Band	Signal Generator Frequency Setting	Dummy Antenna	Connection to Radio	Tuning Condenser Setting	Adjust for maximum output (see chassis view)
I.F.	455 Kc.	.1 mfd.	Grid of 12SA7	Rotor full open (plates out of mesh)	4 trimmers on input and output I.F. transformers
Broadcast	1650 Kc.	.1 mfd.	Grid of 12SA7	Rotor full open (plates out of mesh)	Oscillator trimmer C7 on bottom of radio
	1400 Kc.	None	See note below	Set dial at 1400 Kc.	Antenna trimmer C2 on bottom of radio

Note: Lay output lead of generator in back of loop antenna. Turn up generator output. Loop antenna will pick up energy.

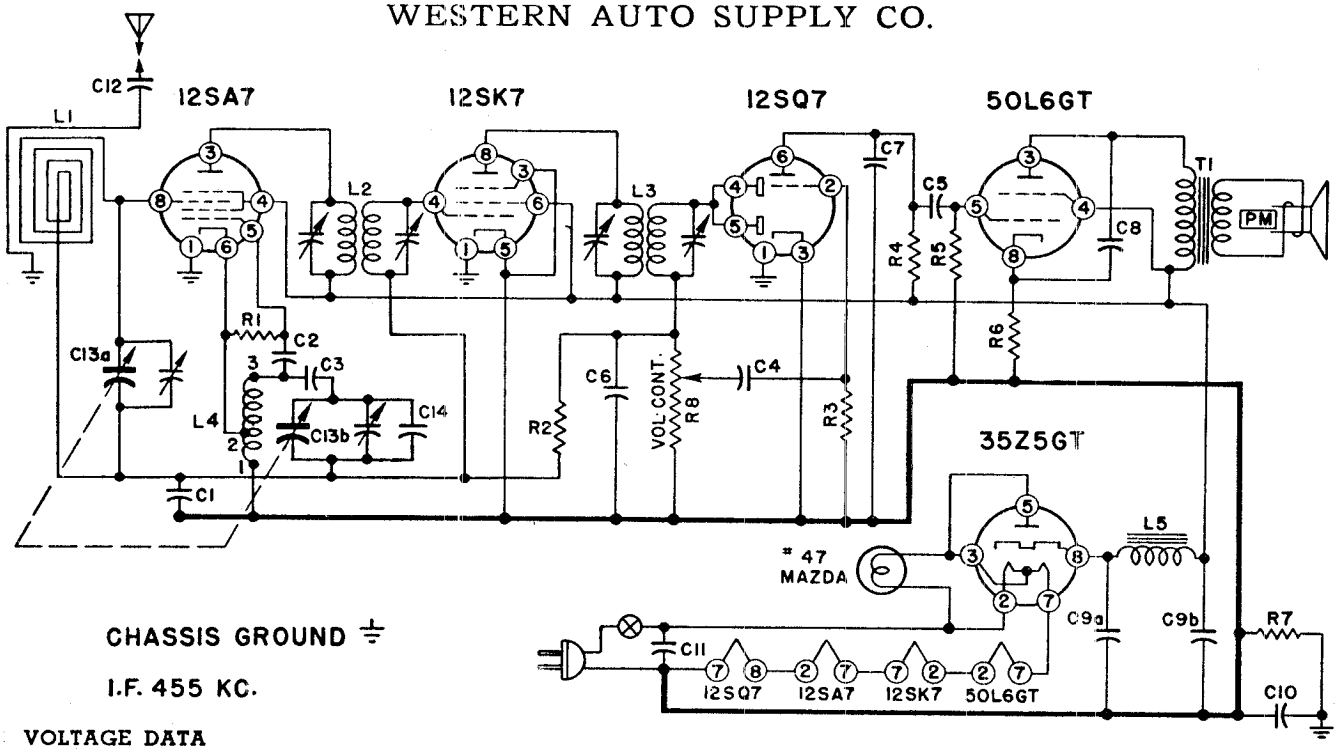
WESTERN AUTO SUPPLY CO.



VOLTAGE DATA

Voltages are measured from the socket terminals and the point marked "X" on the voltage chart. With the dial tuned to the low frequency end, no signal and the volume control set at maximum, a vacuum tube voltmeter was used for all readings. The A.C. line input was 117 volts A.C. for all measurements shown. Where use of a 1000 ohm per voltmeter would result in noticeably lower readings due to the increased drain of this type of instrument, a second reading is shown directly below the initial reading.

POINTER EXTREMES INDICATED BY HOLES IN DIAL BACKGROUND.
600 KC. SETTING INDICATED BY HOLE IN DIAL BACKGROUND.
1400 KC. SETTING INDICATED BY HOLE IN DIAL BACKGROUND.
NOTE:
DIAL BACKGROUND SHOWN TRANSPARENT TO CLARIFY STRINGING—54" OF CORD REQUIRED—GANG IN CLOSED POSITION.

POWER SUPPLY

This receiver is designed to operate from any AC (Alternating Current) power supply line of 110-120 volts, 50-60 cycles or DC (Direct Current) power supply line of 110-120 volts. If the receiver fails to operate after several minutes on DC, reverse the power line plug.

On AC only the line plug should be tried both ways and left in a position that gives minimum hum.

ALIGNING INSTRUCTIONS

All of the adjustments have been very carefully set with signal generators at the factory and require no further adjustment, unless it becomes necessary to replace a coil or transformer, or if the adjustments have been tampered with in the field. Under no circumstances attempt any adjustments without first making certain that adjustment is necessary and only after voltages, tubes and condensers have been checked and found to be normal. To properly re-align this receiver, a signal generator as well as an output meter, must be used. (See next page for full instructions.)

©John F. Rider

MODEL D2620

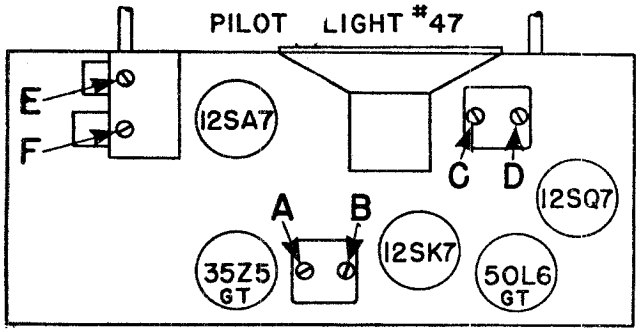
WESTERN AUTO SUPPLY CO.
ALIGNMENT PROCEDURE

- Volume control—Maximum all adjustments.
- Connect radio chassis to ground post of signal generator with a short heavy lead.
- Connect dummy antenna value in series with generator output lead, when needed (see below).
- Connect output meter across primary of output transformer.
- Allow chassis and signal generator to "heat up" for several minutes.

The following equipment is required for aligning:

- An all wave signal generator which will provide an accurately calibrated signal at the test frequencies as listed.
- Output indicating meter.
- Non-metallic screwdriver.

Dummy antenna—.1 mf.



BACK OF CHASSIS

BAND	SIGNAL GENERATOR Frequency Setting	Dummy Antenna	Connection to Radio	Variable Condenser Setting	Trimmers Adjusted (In Order Shown)	Trimmer Function	Adjustment
I. F.	455 KC.	.1 MFD.	Gang Condenser Ant. Stator	Rotor full open (Plates out of mesh)	C, D	Output I.F.	Adjust to maximum output
	455 KC.	.1 MFD.	Gang Condenser Ant. Stator	Rotor full open (Plates out of mesh)	A, B	Input I.F.	Adjust to maximum output
BROAD-CAST	1630 KC.	.1 MFD.	Gang Condenser Ant. Stator	Rotor full open (Plates out of mesh)	E gang-front	Oscillator	Adjust to maximum output
	1400 KC.	Inductive Coupling—Use a loop or place Gen. lead close to Rec. loop. No connection bet. Receiver and Generator		Set dial to tune in Generator Signal	F gang-rear	Antenna	Adjust to maximum output

This is all that is necessary for the alignment unless the plates of the gang have been bent out of shape. In case of bent plates, set the signal generator and receiver to 600 KC and bend the plates into the position for maximum output.

Attenuate the signal from the signal generator to prevent the leveling-off action of the AVC. After each band is completed, repeat the procedure as a final check.

Frequency Range—540 to 1630 K.C.

Intermediate Frequency 455 K.C. Power consumption 30 watts.

REPLACEMENT PARTS

PAPER CONDENSERS

Part No.	Symbol No.	Description
64B1-12	C-12	Condenser, Tubular .005 mfd. 600 V.

MODEL 43-6451

WESTERN AUTO SUPPLY CO. OF CAL.

Model 43-6451

Five Tube Battery Radio

Service Notes

How To Remove Chassis From Cabinet—Remove knobs by pulling straight off, disconnect battery by removing plug, and remove two screws inserted through bottom of cabinet. Chassis can be removed now. To REMOVE GLASS DIAL—remove the four wood screws which are inserted from the interior of cabinet. (Note—After installing chassis in cabinet see that the bakelite strip attached to dial cord is engaged with the pin on the dial pointer.)

To Properly Align—Remove chassis from cabinet, and align I. F. Transformers in the conventional manner with a test oscillator adjusted to 455 KC, connected to the grid of the 1A7GT through a .1 Mfd condenser, with the tuning condenser set at minimum capacity. To align tuning condenser, connect test oscillator to antenna wire (green) through a .0001 Mfd. condenser. Adjust oscillator trimmer condenser (located on left top) to 1620 KC with tuning condenser at minimum capacity (completely out of mesh). The antenna and R. F. sections are trimmed at 1400 KC. Antenna trimmer is top right; R. F. trimmer is below at right. Dial pointer may be adjusted to scale by slipping bakelite pointer coupling on dial cord.

Battery Unit Voltages—Should be checked with receiver turned on—if B voltage is below 60 Volts, battery unit should be replaced.

Dial Cord Replacement—Is best accomplished by replacing complete cord assembly #25811, which is made up to correct length. In an emergency 30 lb. fish line may be used. See picture of chassis for correct installation.

MODEL 43-8685

Model 43-8685

Six Tube AC Operated Radio
Including Rectifier

Service Notes

The circuit diagram below is complete and will enable the serviceman to check all component parts in the event service is required. Voltages at various important points are indicated, as well as values of condensers and resistors.

REMOVAL OF CHASSIS—Disconnect set from wall plug. Remove knobs by pulling straight out. Remove loop plug on back of chassis. Remove two screws under cabinet, chassis may be withdrawn from rear.

ALIGNMENT—Sets are properly aligned at the factory with precision equipment and the adjustments should not be disturbed unless a coil, tuning condenser or IF transformer has to be replaced or the set has been subject to damage or tampering. Alignment should only be done with the aid of an accurate signal generator and output indicating instrument.

TO PROPERLY ALIGN—Remove chassis from cabinet, and align I. F. Transformers in the conventional manner with a Signal Generator adjusted to 455 KC, connected to the grid of the 6SA7 through a .1 Mfd. condenser, with the tuning condenser set at minimum capacity. To align tuning condenser, carefully place loop in normal relation to chassis, connect Signal Generator to antenna clip through a .0001 Mfd. condenser. Adjust oscillator trimmer condenser (located on left top) to 1620 KC with tuning condenser at minimum capacity (complete out of mesh). The antenna and R. F. sections are trimmed at 1400 KC. Antenna trimmer is top right; R. F. trimmer is below at right. Dial pointer may be adjusted to scale by slipping pointer coupling on dial cord.

DIAL CORD REPLACEMENT—Is best accomplished by replacing complete cord assembly No. 25834 which is made up to correct length. In an emergency 30 lb. fish line may be used. See picture of chassis for correct installation.

DIAL SCALE REPLACEMENT—Remove chassis. Remove pointer track by removing the two wood screws holding it to the cabinet. Dial scale may now be lifted out from front of cabinet. When installing new scale —see that long screws in track bracket engage the notches in the ends of the scale.

INSTALLING CHASSIS—Replace chassis in cabinet—noting that shafts are approximately centered in holes. Replace screws under base of cabinet, replace loop plug, push knobs on shafts. Hold the pointer, back of dial, near center of scale, with your finger or any small instrument, turn the tuning knob to the right or left until the pointer drive coupling connects itself with the pointer.

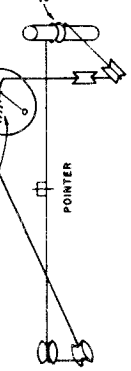
NOTES-
1. SPEAKER PLUG REMOVED.
2. VOICE COIL DISCONNECTED.
3. SWITCH SHOWN AS VIEWED FROM FRONT OF SET IN P.B-B.C. POSITION.
EXTREME COUNTER CLOCKWISE POSITION IS PHONO.
SECOND POSITION CLOCKWISE IS P.B-B.C. BAND.
THIRD POSITION CLOCKWISE IS MANUAL B.C. BAND.
FOURTH POSITION CLOCKWISE IS S.W. BAND.
4. DOT-DASH LINE DENOTES ASSEMBLY OF COMPONENT PARTS UNSHIELDED.
5. ALL VOLTAGES MEASURED FROM CHASSIS (GND.) USING 20,000 OHMS/VOLT METER.
LINE VOLTAGE 117 V.A.C. MAX. VOLUME CONTROL SETTING AT NO SIGNAL CONDITIONS FOR THE BROADCAST BAND.
READINGS SHOULD APPROXIMATE THE VALUES SHOWN WITHIN 20 PERCENT.

Tuning Drive Ratio ..... 30 to 1



DIAL DRIVE MECHANISM

PUSH BUTTONS

Push buttons 1 to 3 are designed to receive stations from 900 to 1600 kc; push buttons 4 to 6 are designed to receive stations from 540 to 900 kc.

1. Turn on radio and allow it to warm up for five minutes.
2. Set the phono-band switch on "BROADCAST." Tune in the desired station in the frequency range 900 to 1600 kc.
3. Reset the phono-band switch on "PUSH BUTTON" and depress the first push button (right button, viewed from the front). Adjust L14, using a small long-handled screwdriver, to receive the station. Adjust C42 for maximum volume on the station.
4. Return the band switch to "BROADCAST" to make sure that the push button has been set to the desired station.
5. Adjust remaining push buttons in the same manner.

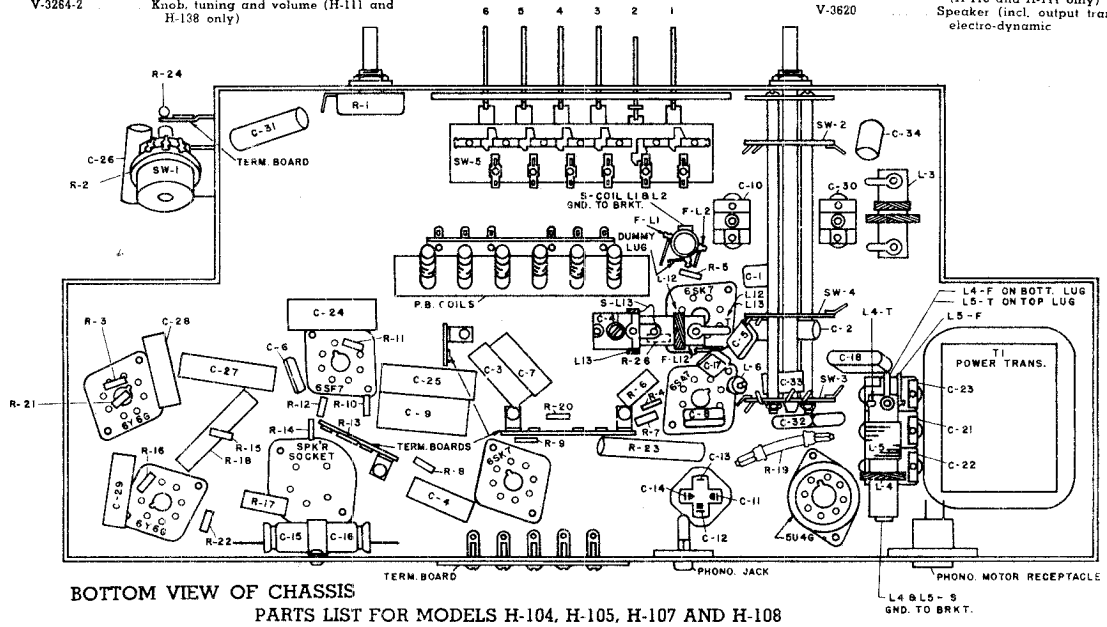
PARTS LIST FOR MODELS H-110, H-111, H-137 AND H-138

The parts listed below for the MODELS H-104, H-105, H-107and H-108 apply to MODELS H-110, H-111, H-137 and H-138 with the following exceptions:

V-3390	Decal, band (H-110 and H-111 only)
V-3792	Decal, band (H-137 and H-138 only)
V-3197	Decal, tone (H-110 and H-111 only)
V-3791	Decal, tone (H-137 and H-138 only)
V-3262-1	Knob, tone (H-110 and H-137 only)
V-3262-2	Knob, tone (H-111 and H-138 only)
V-3262-3	Knob, band (H-110 and H-137 only)
V-3262-4	Knob, band (H-111 and H-138 only)
V-3264-1	Knob, tuning and volume (H-110 and H-107 only)
V-3264-2	Knob, tuning and volume (H-111 and H-138 only)
V-3832-1	Cardboard and grille cloth assy., speaker section (H-110 only)
V-3832-2	Cardboard and grille cloth assy., speaker section (H-111 only)
V-3833-1	Cardboard and grille cloth assy., record storage section (H-110 only)
V-3833-2	Cardboard and grille cloth assy., record storage section (H-111 only)
V-3686-1	Grille cloth, speaker (H-137 only)
V-3686-2	Grille cloth, speaker (H-138 only)
V-3283-1	Loop assembly (L7)
V-3229-2	Moulding, dial
V-3534	Plate, front glass (H-110 only)
V-3819	Plate, front glass (H-111 only)
V-3813	Plate, front glass (H-137 only)
V-3685	Plate, front glass (H-138 only)
V-3639-1	Slide mechanism, left hand unit (H-110 and H-111 only)
V-3639-2	Slide mechanism, right hand unit (H-110 and H-111 only)
V-3620	Speaker (incl. output trans. T2) 10" electro-dynamic



BOTTOM VIEW OF CHASSIS

PARTS LIST FOR MODELS H-104, H-105, H-107 AND H-108

When ordering parts specify model number of set in addition to part number and description of part.

Part No.	Description
V-3615	Asbestos sheet (H-104 and H-105 only)
V-3186	Background, felt
V-3532S	Bar, flat, for phono mtg. (H-107 and H 108 only).
V-3336	Bracket assembly, dial background
V-3185	Bracket, dial light

Pilot Lamp: (1).....Westinghouse No. 47, 6.3 volts, .15 ampere

Frequency Range:

Standard Broadcast .....550 to 1600 kc
Intermediate Frequency .....455 kc

Phonograph Specifications:

1. Automatic record changer, single button control.
2. Plays either 12 ten-inch or 10 twelve-inch records automatically.
3. Balanced tone arm.
4. Voltage and frequency of motor - 105 - 120 volts, 50 - 60 cycles, single phase a.c.
5. Type of cartridge - high impedance crystal.
6. Type of needle - straight shank steel or semi-permanent sapphire.

Record Changer: General Instrument Model 205

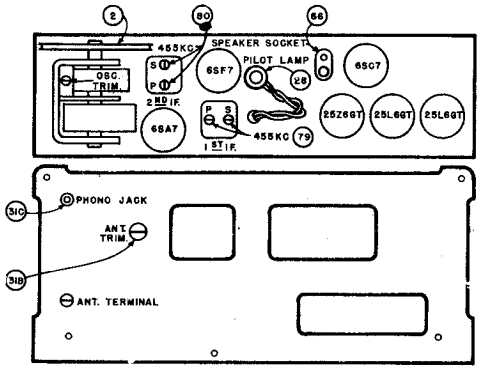
Alignment Procedure

The overall sensitivity and selectivity of these models is affected to a great extent by the alignment of the i-f and r-f circuits. In general, a complete realignment of both circuits is unnecessary. If realignment is required, however, the following procedure must be used:

1. Disconnect the receiver from the 105-120 volt power source.
2. Remove the rear cover - loop assembly as outlined above.
3. Pull off the four knobs at the front of the cabinet.
4. Remove the pilot lamp socket from the speaker bracket. Remove the speaker plug from its socket. This socket is located at the front of the chassis near the 6SC7 tube.
5. To release the chassis, remove the two screws from the bottom of the cabinet.
6. Reconnect the speaker. Place the power plug in the 105-120 volt a-c or d-c convenience outlet and set the controls on the front as follows:
   a. Volume control and a-c switch - full on.
   b. Radio-phonograph switch - in RADIO position (extreme counter clockwise).
   c. Tone control - HIGH position (extreme clockwise).
   d. Tuning dial - 1600 kc position.
7. Connect the signal generator to the control grid of the 6SF7 i-f amplifier tube through a series capacitor of 0.1 mfd. Adjust the signal generator for an output frequency of 455 kc; keep the signal reduced to avoid a.v.c. action.
8. Connect an a-c output meter across the speaker voice coil; place the meter range switch on the highest output scale position for the preliminary adjustments.
9. Using an alignment tool, adjust the secondary trimmer of the second i-f transformer for the maximum output indication on the meter. As the circuits come into alignment, it will be necessary to further reduce the test signal amplitude in order to prevent a.v.c. action. Always use the lowest range on the meter which will give at least one-half scale deflection. Adjust the primary trimmer of the second i-f transformer for maximum output indication.
10. Connect the signal generator output to the control grid of the 6SA7 mixer tube, and adjust in turn, the secondary and primary trimmers of the first i-f transformer for maximum output indication.
11. Leave the signal generator connected to the control grid of the 6SA7 mixer tube. Reduce the test signal to the lowest perceptible value and carefully "peak" each adjustment in Steps 9 and 10 for maximum output indication.
12. Connect the signal generator to the antenna terminal on the back cover - loop assembly through a capacitor of approximately 200 mmfd.; adjust the signal generator to an output frequency of 1615 kc. Rotate the tuning condenser until the minimum capacity stop is reached, and adjust the oscillator trimmer for the maximum response on the output meter.
13. Disconnect the signal generator test lead from the antenna terminal. Turn attenuator on the signal generator for full output. Adjust the signal generator for 1400 kc. Bring the output lead near, but do not connect to, the loop antenna. Tune in the test signal as accurately as possible on the radio. If the test signal is too strong, move the lead farther away. Adjust the antenna trimmer for maximum output on the meter.

    Note: The antenna trimmer must be readjusted after the chassis is replaced in the cabinet as the metal chassis and speaker affect the inductance of the loop.
14. Check on radio stations at selected points for calibration and sensitivity.



The foregoing alignment procedure is condensed in the following table as a convenience for the service technician.

Steps	Connect Signal Generator to—	Adjust Signal Generator to—	Tune Radio Dial to—	Adjust
1	6SF7 control grid through 0.1 mfd. capacitor	455 kc	1600 kc	secondary trimmer of 2nd i-f transformer for maximum output
2	6SF7 control grid through 0.1 mfd. capacitor	455 kc	1600 kc	primary trimmer of 2nd i-f transformer for maximum output
3	6SA7 control grid through 0.1 mfd. capacitor	455 kc	1600 kc	secondary trimmer of 1st i-f transformer for maximum output
4	6SA7 control grid through 0.1 mfd. capacitor	455 kc	1600 kc	primary trimmer of 1st i-f transformer for maximum output
5	antenna terminal through 200 mmfd. capacitor	1615 kc	gang at minimum	trimmer of oscillator section, tuning capacitor for maximum output
6	radiated signal (no actual connection)	1400 kc	1400 kc	antenna trimmer for maximum output

Power Supply Polarity:

When the receiver is operated on 105-120 volts 60 cycles a.c., a slight hum may be heard if the power plug is inserted in such a manner that the "hot" side of the supply line is connected nearest to the chassis. To eliminate this trouble, reverse the plug in the convenience outlet.

When operated on direct current, the set will not function at all if the power plug polarity is reversed with respect to the line voltage. If it does not function within one minute after it is turned on, reverse the plug.

Ground Connection:

The use of an external ground is not recommended for two reasons: First, the r-f circuits are returned to ground through the a-c or d-c supply line; second, the radio chassis is connected to one side of the supply line through a 220,000 ohm resistor and a capacitor of 0.2 mfd. If the power plug is inserted in such a manner that the "hot" side of the supply line is connected nearest to the chassis, the use of an external ground would place the 105-120 volt supply voltage directly across the resistor-capacitor combination. This might cause a loud hum or, under certain conditions, actual damage to the receiver.

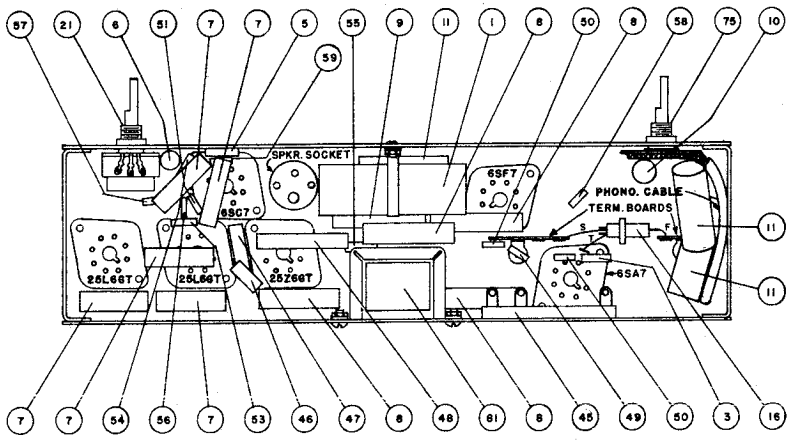
53	RC20AE184K	Resistor, 180,000 ohms ½ watt
54	RC20AE224K	Resistor, 220,000 ohms ½ watt
55	RC10AE224M	Resistor, 220,000 ohms ¼ watt
56	RC10AE274K	Resistor, 270,000 ohms ¼ watt
57	RC10AE334K	Resistor, 330,000 ohms ¼ watt
58	RC10AE225M	Resistor, 2.2 megohms ¼ watt
59	RC10AE106M	Resistor, 10 megohms ¼ watt
65	V-3398-1	Socket, regular a.c. power
66	V-3299	Socket, speaker
70	V-3291	Speaker, 6" PM
75	V-3301	Switch, radio phono
79	V-3328	Transformer, 1st i-f
80	V-3329	Transformer, 2nd i-f



81	V-3297	Transformer, output
	V-3219S-1	Cord, dial drive
	V-3343	Pointer assembly
	V-3321	Rail, pointer
	V-3335	Socket, pilot light
	V-3246S	Socket
	V-3248S	Spring, dial drive
	V-1109-1	Cabinet (radio section H-122 only)
	V-1110-1	Cabinet (less radio section H-122 only)
	V-1111-2	Cabinet (H-130 only)
	V-3425	Dial (H-122 only)
	V-3647-2	Dial (H-130 only)
	V-3413	Knob, tone (H-122 only)
	V-3262-2	Knob, tone (H-130 only)
	V-3413	Knob, tuning (H-122 only)
	V-3262-2	Knob, tuning (H-130 only)
	V-3331-1	Knob assembly, volume (H-122 only)
	V-3667-2	Knob assembly, volume (H-130 only)
	V-3331-2	Knob assembly, radio-phono (H-122 only)
	V-3667-4	Knob assembly, radio-phono (H-130 only)
	V-3333S-1	Medallion

Power Output:

Undistorted (radio) ..... 3 watts
Undistorted (phonograph) .....3.5 watts
Maximum ..... 5 watts

Loudspeaker:

Type .....6⅝" dia. P.M. dynamic
Voice Coil Impedance .....3.2 ohms

Power Supply Rating:

H-122 combination .....105 - 120 volts, 50 - 60 cycles a.c.
H-130 or radio section of H-122 only .....105 - 120 volts d.c. or 105 - 120 volts, 50 - 60 cycles a.c.

Power Consumption:

H-122 combination .....150 watts
H-130 or radio section of H-122 .....60 watts

Special Provisions:

H-130: Phonograph, FM, and television sound input connection at rear of cabinet
H-122: FM and television sound input connection at rear of cabinet

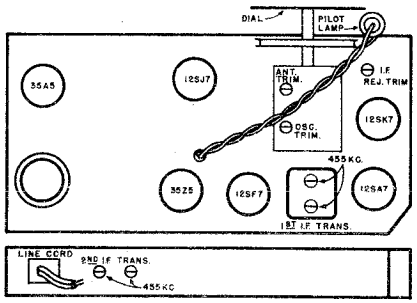

Fig. 1

Alignment Procedure (Refer to Fig. 1):

The overall sensitivity and selectivity of the Little Jewel are affected to a great extent by the alignment of the i-f and r-f circuits. In general, a complete realignment of both circuits is unnecessary. If realignment is required, however, the following procedure is recommended:

1. Remove the knobs, the plastic cover, and the loop as outlined above.
2. Remove the Allen head screw from the left-hand plastic cover and carefully lift off the cover.
3. Turn on the receiver and tune to a quiet spot near 1600 kc.
4. Connect an a-c output meter across the speaker voice coil. Turn the meter range switch to a high-voltage position.
5. Connect the outer conductor of the signal generator test lead to the common negative (this is the metal can enclosing the filter capacitors). Reduce the output of the signal generator to prevent a.v.c. action during the alignment procedure.
6. Connect the inner conductor of the signal generator test lead to the 12SF7 i-f amplifier control grid through a capacitance of 0.01 mfd. Adjust the signal generator frequency to 455 kc.
7. With an insulated screwdriver or neutralizing tool, adjust the second i-f transformer **secondary** trimmer for maximum reading on the output meter. Use the lowest practicable scale on the meter and, as the circuits come into alignment, reduce the signal generator output to prevent a.v.c. action.
8. Repeat operation 7, this time adjusting the second i-f transformer **primary** trimmer.
9. Connect the signal generator output, through the 0.01 mfd. capacitor, to the control grid of the 12SA7 converter tube. Repeat operations 7 and 8, this time adjusting the secondary and primary trimmers of the **first** i-f transformer.
10. Connect the signal generator output, adjusted to 455 kc, to the antenna terminal at the bottom of the cabinet. Tune the radio dial to 600 kc. Adjust the i-f rejection trimmer for **minimum** reading on the output meter.
11. Connect the test oscillator output through a capacitance of 50 mmfd. to the antenna terminal at the bottom of the cabinet. Adjust the signal generator frequency to 1615 kc. Tune the receiver tuning condenser to minimum. Adjust the trimmer on the oscillator section of the main tuning condenser for **maximum** reading on the output meter.
12. Adjust the signal generator to 1400 kc. Bring the output lead near the receiver input but do not make an actual connection. Tune in the test signal on the receiver dial and adjust the antenna trimmer for maximum output as read on the output meter.

The foregoing alignment procedure is condensed in the following table as a convenience for the service technician:

Steps	Connect Signal Generator to—	Adjust Signal Generator to—	Tune Radio Dial to—	Adjust for Maximum Output
1	12SF7 grid in series with a .01 mfd. capacitor	455 kc	quiet point near 1600 kc.	primary and secondary 2nd i-f transformer
2	12SA7 grid in series with a .01 mfd. capacitor	455 kc	quiet point near 1600 kc.	primary and secondary 1st i-f transformer
3	12SA7 grid in series with a .01 mfd. capacitor	455 kc	quiet point near 1600 kc.	repeat 1 and 2
4	antenna terminal	455 kc	600 kc	adjust i-f rejection trimmer for minimum output
5	antenna terminal in series with a 50 mmfd. capacitor	1615 kc	gang at minimum	oscillator trimmer
6	radiated signal from signal generator	1400 kc	1400 kc	adjust antenna trimmer

Power Supply Polarity:

When the receiver is operated on 110 volts 60 cycles a.c., a slight hum may be heard if the power plug is inserted in such a manner that the "hot" side of the supply line is connected nearest to the chassis. To eliminate this trouble, reverse the supply plug in the convenience outlet.

When operated on direct current, the set will not function at all if the power plug polarity is reversed with respect to the line voltage. If it does not operate within one minute after it is turned on, reverse the plug in the convenience outlet.

Tube Replacement:

When replacing tubes this procedure must be followed to prevent damage to the loop and other delicate parts:

1. Disconnect the power plug from the 110-volt service outlet.
2. Pull the knobs and remove the Phillips head screw from the right-hand plastic cover.
3. Carefully remove the plastic cover and handle.
4. Lift the loop assembly and tilt it forward until the tubes are accessible.
5. Turn the tuning dial to 550 kc to avoid damage to the rotor plates of the tuning condenser.

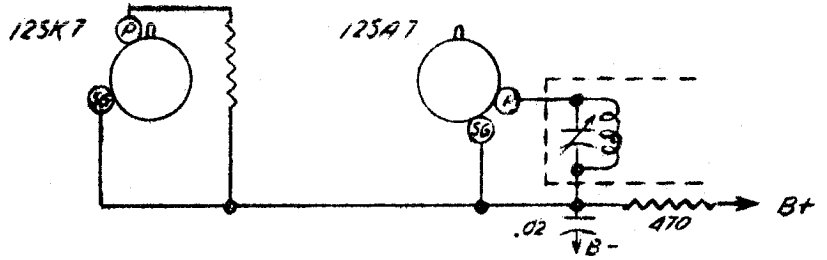
SUBJECT: CIRCUIT CHANGE, H-125 and H-126 Radios

Effective July 11, 1946, all Model H-125 and H-126 radios which have the letter "C" stamped on the end of the chassis directly below the output tube, have been changed as follows:

A 470 ohm 1/4 watt isolating resistor has been inserted in the plate and screen supply line for the R.F. and converter stages, and a .02 mfd, 200 volt paper by-pass capacitor has been connected from the tube side of this resistor to the common negative line. These connections are shown below.



Where this change has been incorporated in the radio, voltages at the R.F. and converter tube sockets will differ slightly from the values given in the original Service Notes. Approximate voltages when the change is incorporated are as follows: 12SK7 screen grid 66 V., plate 30 V.; 12SA7 screen grid 66 V., plate 65 V.

Procurement difficulties with respect to certain components make the change advisable at this time.

ALIGNMENT PROCEDURE

IF USING A CATHODE RAY OSCILLOGRAPH, THE VERTICAL "HIGH" TERMINAL IS TO BE CONNECTED TO THE 1H5GT GRID CAP WITH A 2.0 MEG. RESISTOR IN SERIES AT THE GRID END.

FOR THE I.F. ALIGNMENT USE A DUMMY ANTENNA CAPACITOR OF .01 MFD. AND COUPLE TEST SIGNAL TO GRID CAP OF THE 1A7GT.

FOR PRELIMINARY ADJUSTMENT OF THE OSCILLATOR CIRCUIT USE THE SAME DUMMY ANTENNA AND CONNECTION POINT. FEED THE TEST GENERATOR TO THE ANTENNA LEAD USING A 200 MMFD. CAPACITOR AS A DUMMY ANTENNA, ADJUST THE ANTENNA TRIMMER C-4 FOR MAXIMUM AT 1500 KC/S. THEN READJUST THE OSCILLATOR SHORTED LOOP FOR MAXIMUM AT 600 KC/S WHILE ROCKING THE GANG CAPACITOR. RECHECK AT 1500 KC/S.

MODELS 4K016—4K035
CHASSIS Nos. 4C52—4C53

TO THE SERVICE MAN:

The alignment of this chassis is conventional.

A 4700 ohm resistor R5 between the low end of the volume control and ground allows some audio output with normal signal input when the volume control is in counter clockwise positions. This is the Guardian Reminder circuit.

If the audio output is objectionably high (with the volume control in counter clockwise position) resistor R5 may be reduced in value to 2500 ohms or removed from the circuit and the low end of the control grounded.

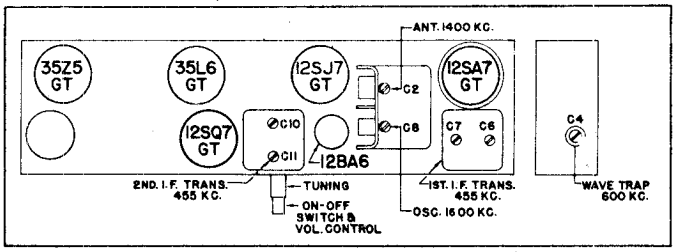
MODELS 6D015—6D030
CHASSIS No. 6C05

TO THE SERVICE MAN:

The filter circuits of chassis 6C05 incorporate new features that should be well understood by the service man. An examination of the schematic drawing will show the output transformer tapped slightly off center. This tap is the B + connection from filter resistor R11 and capacitor C19 off the cathode of the rectifier 35Z5 to the 35L6 plate. The lower connection of the output transformer feeds B + to the rest of the tubes in the receiver. Current flowing through the upper windings of the output transformer to the 35L6 produces a magnetic field which is 180° out of phase with the magnetic field produced by current flowing in the opposite direction through the output transformer to the rest of the receiver, therefore, most of the AC hum is cancelled. Further reduction of hum is accomplished by filtering through resistor R10 and 12 and capacitors C17 and 18.



TUBE AND TRIMMER LOCATION

This development in filtering systems allows a higher effective plate voltage on the 35L6 for increased power output.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 206-547. Be sure to add the speaker code letter to the transformer part number.

This receiver is equipped with a Phono Jack and Plug located on the rear of the chassis. To use the receiver with a record player, set the Band Switch to one of the short-wave bands and control the volume of the record reproduction with the receiver Volume Control.

PHONO

Este receptor está provisto de una conexión para el fonógrafo, y una clavija o toma, situadas en la parte posterior del chásis. Para usar el receptor con un "Tocadiscos," ajuste el cambio de banda a una de las bandas de onda corte y cambie el volumen del sonido por medio del control de volumen del receptor.

PHONO

Ce récepteur est pourvu d'une "Cheville de Phonographe" et une prise, qui se trouvent au dos du châssis. Pour employer le poste avec un appareil phonographique externe ("record player"), tournez le commutateur sélectionneur de bandes à une des bandes d'ondes courtes, et réglez le volume du son au moyen du contrôle du volume du poste.

INSTRUCCIONES PARA LA INSTALACION Y FUNCIONAMIENTO

INFORMACION GENERAL

Después de desembalar el receptor, el papel engomado usado en embalaje y embarque, tiene que quitarse del chasis.

Este receptor es un moderno aparato superheterodino, de cinco tubos, que sintoniza las bandas de onda larga y corta, como sigue: 540 a 1660 Kc. (555 a 180 metros), 2100 a 7300 Kc. (143 a 41 metros), 6800 a 22,500 Kc. (44 a 13.3 metros) y una gama de ondas especial desde 9400 a 12,200 Kc. (31.9 a 24.6 metros) con ensanchamiento de banda en 25 y 31 metros.

El receptor está provisto de altoparlante de imán permanente del tipo electro-dinámico, y un regulador de tono de dos posiciones.

SUMINISTRO DE ENERGIA

Este receptor funciona con un acumulador de 6 voltios solamente.

Consumo de energía del chasis con altoparlante de imán permanente es de 2.2 amperios. El máximum de salida de fuerza es de 2.2 vatios.

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

After the receiver has been unpacked from the carton, the paper tape used for packing and shipping must be removed from the chassis.

This receiver is a modern five tube superheterodyne, tuning over the following standard broadcast and short-wave bands: 540 to 1660 Kc (555 to 180 meters), 2100 to 7300 Kc (143 to 41 meters), 6800 to 22,500 Kc (44 to 13.3 meters), and a special range covering 9400 to 12,200 Kc (31.9 to 24.6 meters) with spread bands at 25 and 31 meters.

It is equipped with a permanent magnet dynamic type speaker and a two position tone control.

POWER SUPPLY

This receiver operates from a 6 volt storage battery only.

Power consumption of the receiver is 2.2 amperes. The maximum power output is 2.2 watts.

LES INSTRUCTIONS POUR L'INSTALLATION ET LE FONCTIONNEMENT

GENERAL

Après déballage du récepteur de la boite en carton, la bande de papier-cache employée pour l'emballage et l'expédition doit être enlevée du châssis.

Le présent poste est un récepteur superhétérodyne moderne à cinq lampes, dont l'accord englobe les bandes standard suivantes d'ondes moyennes et d'ondes courtes: 540 à 1660 Kc. (555 à 180 mètres), 2100 à 7300 Kc. (143 à 41 mètres), 6800 à 22,500 Kc. (44 à 13.3 mètres), et une échelle spéciale qui couvre de 9400 à 12,200 Kc. (31.9 à 24.6 mètres) avec épanouissement des bandes à 25 et 31 mètres.

Ce poste est équipé avec un haut parleur à aimant permanent du type électro-dynamique, et un contrôle de son à deux positions.

ALIMENTATION DE COURANT

Ce récepteur de TSF ne fonctionne qu'avec accu de six volts.

La consommation de courant du châssis utilisant le haut parleur à aimant permanent est de 2.2 ampères. Le débit maximum de puissance est de 2.2 watts.

¡OJO!
Es indispensable que las terminales del acumulador estén conectadas a la terminal positiva o negativa correspondientes. De lo contrario, no se puede obtener recepción y el vibrador puede dañarse.

CAUTION
Be certain that the battery clips are connected to the proper plus and minus terminals of the battery; otherwise reception cannot be obtained and the vibrator may be damaged.

PRECAUTION
S'assurer que les pattes d'attache sont connectées avec les propres bornes plus ou mois de l'accu, comme autrement on n'aura pas de réception et le vibrateur pourra s'avarier.

ANTENA

Una buena antena es indispensable para la recepción de radio. Una antena exterior de 13 a 20 metros instalada lo más alto posible es la más apropiada para uso general. Si se ha de suar una antena ya instalada, ésta debe examinarse minuciosamente para determinar su estado pues puede haber conexiones oxidadas o rotas, que nulifican la eficacia de la antena. Por otra parte si ha de instalarse una antena nueva hay que tomar las precauciones necesarias para que el alambre de bajada no haga contacto con la pared o con cualquier objeto que resulte en una conexión a tierra. Todas las conexiones deben estar correctamente soldadas para prevenir contra la oxidación y los ruidos que se producen a consecuencia de esto.

ANTENNA

A good antenna is necessary for satisfactory reception. An outside antenna from 40 to 60 feet in length and as high as possible will give good all around results. If your present antenna is to be used, a thorough examination should be made to determine its condition, as the connections may be corroded or broken thus rendering the antenna unfit for service. If a new antenna is to be constructed, care should be taken to prevent the lead-in wire from grounding to trees, walls or gutters and all connections should be properly soldered to prevent corrosion and resulting noise. Connect the antenna lead-in to the post marked "A" at the back of the chassis.

ANTENNE

Une bonne antenne s'impose pour obtenir une réception satisfaisante. Une antenne extérieure de 13 à 20 mètres de long et placé aussi haut que possible donnera d'excellents résultats pour tout service. Si vous vous proposez d'utiliser votre antenne actuelle, il conviendra d'en faire un examen approfondi pour en déterminer l'état car les connexions peuvent en être rouillées ou rompues, ce qui rendrait l'antenne impropre à l'emploi. Si on décide de construire une nouvelle antenne, il convient de veiller á ce que le fil d'entrée ne rejoigne pas la terre par des arbres, des murs ou des gouttières, et toutes les connexions devront être soudées avec soin pour prévenir la corrosion et les parasites qui en résulterai-

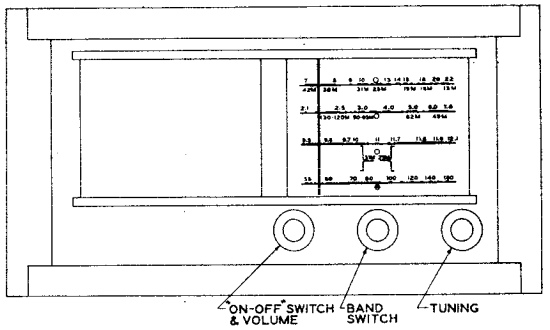

FIG. 1. CONTROLS.

©John F. Rider

Conéctese el alambre de bajada de la antena a la terminal marcada "A" en la parte trasera del chasis.

TIERRA

Una conexión a tierra bién hecha mejorará considerablemente la recepción aumentando la fuerza de las señales de estaciones lejanas y reduciendo el ruido de fondo. La conexión de tierra más satisfactoria consiste en una sección de tubería de un metro a 1.50 metros de largo, colocada verticalmente y casi cubierta de tierra húmeda; un extremo de la conexión a tierra se conecta a la terminal marcada "G" en el chasis.

FUNCIONAMIENTO

(Véase la fig. 1). El grabado indica la posición y propósito de cada perilla. Haciendo girar la perilla combinada interruptor (ON-OFF) y regulador de volumen hacia la derecha, el receptor empieza a funcionar. Las válvulas requieren un minuto más o menos para calentarse. Para aumentar el volumen es necesario girar la perilla hacia la derecha. El volumen se reduce haciendo girar la perilla hacia la izquierda y el receptor se apaga cuando se oye el ruido del interruptor.

Para sintonizar una estación gírese la perilla selectora hasta que la aguja indique la frecuencia deseada. La sintonización debe hacerse en el centro de la frecuencia de la onda para obtener la mejor calidad de tono posible.

El tono se cambia por medio de un interruptor en la parte atrás del receptor, de "Treble" (alto) a "Bass" (bajo).

El receptor tiene cuatro gamas de onda, y cualquiera de ellas puede seleccionarse por medio del conmutador de bandas. La banda que se está usando estará indicada por medio de un punto rojo en el centro de la escala correspondiente.

GROUND

A good ground will aid reception materially by improving the signal strength of distant stations and reducing background noise. The best ground is a 4 to 6 foot pipe driven down to damp earth; the ground lead-in should be securely soldered to this.

A suitable ground may be obtained by making a good connection to a water pipe or radiator. Connect the ground lead-in to the post marked "G" at the rear of the chassis.

PLACING THE RECEIVER IN OPERATION

Note figure 1. This shows the position and purpose of each control. Turning the combination "ON-OFF" switch and volume control to the right will turn the receiver ON. Approximately one minute will be required for the tubes to heat to operating temperature. Continued rotation of this knob to the right increases the volume. Turning this control to the left decreases the volume and, when a click is heard, turns the receiver OFF.

When tuning in a station turn the tuning knob slowly to the desired station. Care should be taken to tune the receiver to the middle of the signal, otherwise the tone will be impaired.

The tone may be changed by means of the switch at the back of the radio from "Treble" to "Bass."

The receiver has four tuning ranges, any one of which may be selected by means of the band switch. The band in use will be indicated by a red dot in the center of the corresponding scale.

Daylight has a decided effect on the reception of short wave stations and different wave lengths are most effective at different times of the day. The following table may be used as a guide.

PRISE DE TERRE

Une bonne prise de terre aidera notablement la réception en améliorant la force du signal pour les stations distantes et en réduisant le bruit de fond. La meilleure prise de terre consiste d'un tuyau de 4 à 6 pieds qu'on enfonce dans le sol humide; la prise de terre devra y être solidement soudée.

On peut réaliser une prise de terre convenable en établissant une bonne connexion au tuyau d'eau ou à un radiateur. Reliez la prise de terre au montant marqué "G" à l'arrière du châssis.

MISE DU RECEPTEUR EN SERVICE

Notez la fig. 1. Elle montre la position et l'objet de chaque contrôle. En tournant le commutateur combinaison interrupteur "ON-OFF" et contrôle du volume, vers la droite, le récepteur sera mis en circuit. Il faut compter environ 1 minute pour que les lampes se chauffent à la tempèrature de fonctionnement. En continuant de tourner ce bouton vers la droite, le volume augmente en intensité. En tournant ce même contrôle vers la gauche, on diminue le volume de sonorité et; quand on entend un léger clic, c'est qu'on a mis le récepteur hors circuit.

Quand vous accordez une station, tournez le bouton de syntonisation lentement jusqu'à ce que vous ayez obtenu la station désirée. Il convient de veiller à accorder le poste au milieu de la fréquence d'onde correspondante; autrement le ton en sera affecté.

Le ton peut être modifié au moyen du commutateur qui se trouve à l'arrière du poste, et cela de la position "Treble" (haut) à "Bass" (bas).

Le récepteur possède quatre échelles d'accord parmi lesquelles on peut sélectionner l'une quelconque d'entre elles au moyen du commutateur sélectionneur de bandes. La bande en usage sera indiquée par un point rouge au centre de l'échelle correspondante.

La réception radiophonique sur ondes courtes est définitivement affectée par la lumière du jour et la réception sur différentes longueurs d'ondes est plus ou moins efficace à différents moments de la journée. Nous donnons à gauche un barème qui peut être suivi pour l'écoute des différentes stations pendant le jour ou la nuit.

LAMPES

Les lampes suivantes sont employées sur ce poste:

7Q7 – 7B7 – 7C6 – 6L5G et 1J6G.

La figure 2 montre la douille correcte pour chaque lampe.

La luz del día tiene una decidida influencia sobre la recepción de la onda corta y diferentes longitudes de onda alcanzan mayor eficacia a diferentes horas del día. El cuadro a la derecha puede ser usado como guía para sintonizar a diferentes horas del día y la noche.

VALVULAS

Este receptor usa las válvulas siguientes:

7Q7 – 7B7 – 7C6 – 6L5G y 1J6G.

La fig. 2 muestra la posición de las válvulas.

SHORT WAVE BAND	TIME OF BEST RECEPTION
16 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

TUBES

The following tubes are employed in this receiver:

7Q7 – 7B7 – 7C6 – 6L5G and 1J6G.

Figure 2 shows the correct socket for each tube.

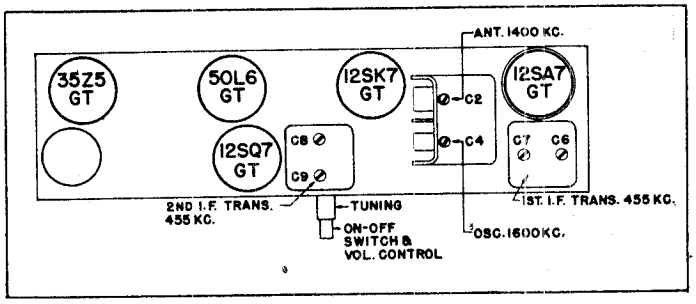
TO THE SERVICE MAN:

The filter circuits of chassis 5C01 incorporate new features that should be well understood by the service man. An examination of the schematic drawing will show the output transformer tapped slightly off center. This tap is the B+ connection from filter resistor R10 and capacitor C18 off the cathode of the rectifier 35Z5 to the 50L6 plate. The lower connection of the output transformer feeds B+ to the rest of the tubes in the receiver. Current flowing through the upper windings of the output transformer to the 50L6 produces a magnetic field which is 180° out of phase with the magnetic field produced by current flowing in the opposite direction through the output transformer to the rest of the receiver, therefore, most of the AC hum is cancelled. Further reduction of hum is accomplished by filtering through resistor R9 and 11 and capacitors C16 and 17. Capacitor C15 across the primary of the output transformer by passes high frequency back to ground.



TUBE AND TRIMMER LOCATION

This development in filtering systems allows a higher effective plate voltage on the 50L6 for increased power output.

NOTE: The output transformer must be replaced with an exact duplicate Part No. 202-549. Be sure to add the speaker code letter to the transformer Part number.

TO THE SERVICE MAN:

The 5C02 and 5C04 chassis are identical electrically. Chassis 5C02 has a Record Reject push button switch on the receiver control panel to reject records.

The socket P1 is used to connect the automatic record changer to the receiver.

The Phono-Radio switch is a two position double acting push-button switch and when in the "in" position connects the changer for playing records.

Chassis 5C04 has the same Phono-Radio switch arrangement. However, the 5C04 does not have socket P1 and the Record Reject switch. The record player is connected to the receiver by a shielded cable and socket arrangement.

MODEL NO. 5D012T

Chassis No. 5C60T

INSTRUCCIONES PARA INSTALACION, FUNCIONAMIENTO Y SERVICIO

GENERALIDADES

Después de desembalar el receptor de su caja de cartón, deberá quitarse del chasis las bandas de papel engomado usado para el empaque y embarque.

Este receptor es un superheterodino moderno que sintoniza sobre las siguientes escalas de onda larga y de onda corta: 545 a 1520 Kc. (550 a 197 metros), 2350 a 7100 Kc. (127.7 a 42.3 metros), 6900 a 22,000 Kc. (43.5 a 13.6 metros).

SUMINISTRO DE ENERGIA

El receptor puede ser usado ya sea conectado a corriente alterna (C.A.) de 25 a 60 ciclos, o a corriente continua (C.C.)

IMPORTANTE

Este receptor es enviado de la fábrica para ser usado sobre una corriente de 210-250 voltios. Para ajustar el receptor para una corriente de 115 voltios retire el tornillo de cierre del tubo de resistencia. Retire el tubo de su portatubo y vuelva a insertarlo en la posición 115 voltios, indicada sobre el chasis.

Si el receptor no comienza a funcionar dentro de un minuto cuando se le conecta a una corriente continua, la ficha de contacto debe ser invertida en el enchufe de la pared. Debe emplearse también este procedimiento en caso de escucharse un zumbido cuando el receptor funciona con corriente alterna.

El consumo total de energía cuando funciona con 115 voltios, es de 25 watios; y cuando funciona con 230 voltios, es de 58 watios.

La máxima producción de energía funcionando con 115 voltios es de 1.4 watios; y con 230 voltios, es de 3 watios.

IMPORTANTE

Se dispone de resistencias especiales para funcionar con suministros de energía de los siguientes voltajes:

150 Voltios. Parte No. 100-87
175 Voltios. Parte No. 100-89
200 Voltios. Parte No. 100-91

Estos tubos de resistencia deben ser insertados de tal manera que el alfiler de inserción esté en la posición de 220 voltios, de lo contrario no funcionará el receptor.

Es indispensable una buena antena para obtener una recepción satisfactoria. Una antena exterior de 13 a 20 metros de longitud y de la mayor altura posible, dará buenos resultados para uso general. Si ha de usar su antena actual, ésta debe ser minuciosamente examinada para determinar su estado, ya que las conexiones pueden estar oxidadas o interrumpidas, haciéndola inapropiada para el uso. Si se ha de instalar una nueva antena hay que tomar las precauciones necesarias para

ANTENNA

A good antenna is necessary for satisfactory reception. An outside antenna from 40 to 60 feet in length and as high as possible will give good all-around results. If your present antenna is to be used, a thorough examination should be made to determine its condition, as the connections may be corroded or broken, thus rendering the antenna unfit for service. If a new antenna is to be constructed, care should be taken to prevent the lead-in wire from grounding to trees, walls or gutters and all connections should be properly soldered to prevent corrosion and resulting noise. Connect on alternating current.

The total power consumption when operated on 115 volts is 25 watts, and when operated on 230 volts, 58 watts.

The maximum power output on 115 volts is 1.4 watts and on 230 volts is 3 watts.

IMPORTANT

Special ballasts are available for operation with power supplies of the following voltages:

150 Volt...Part No. 100-87
175 Volt...Part No. 100-89
200 Volt...Part No. 100-91

These ballast tubes must be inserted so the hold down bracket is in 220 volt position or the receiver will not operate.

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

After the receiver has been unpacked from the carton, the paper tape used for packing and shipping must be removed from the chassis.

This receiver is a modern superheterodyne, tuning over the following standard broadcast and short-wave bands: 545 to 1520 Kc. (550 to 197 meters), 2350 to 7100 Kc. (127.7 to 42.3 meters), 6900 to 22,000 Kc. (43.5 to 13.6 meters).

POWER SUPPLY

The receiver may be used on either alternating current (A.C.) of 25 to 60 cycles or direct current (D.C.).

IMPORTANT

This receiver is shipped from the factory for use on 210-250 volt power supply. To adjust the receiver for 115 volt power supply, remove the locking screw on the ballast tube. Remove the tube from its socket and reinsert it in the 115 volt position as indicated on the chassis.

If the receiver does not operate within one minute when connected to direct current, the power plug should be reversed at the wall socket. This procedure should also be followed if a hum is apparent when the receiver is operated

INSTRUCTIONS POUR INSTALLATION, OPERATION ET SERVICE

GENERALITES

Après avoir déballé le poste-récepteur de son cartonnage, les bandes de papier utilisées pour l'empaquetage et le transport seront enlevées du chassis.

Ce poste est un superhétérodyne moderne dont la syntonisation couvre les échelles de réception des ondes longues et des ondes courtes suivantes: de 545 à 1520 Kc. (de 550 à 197 mètres), de 2350 à 7100 Kc. (de 127,7 à 42,3 mètres), de 6900 à 22,000 Kc. (43,5 à 13,6 mètres).

SOURCE DE PUISSANCE

On peut employer ce récepteur soit avec du courant alternatif (C.A.) de 25 à 60 cycles, soit avec du courant continu (C.C.).

AVIS

Ce récepteur a été prévu par la fabrique pour usage avec une source de puissance de 210 à 225 volts. Afin d'adapter le récepteur à une source de puissance de 115 volts, enlevez la vis d'attache du tube de résistance. Enlevez le tube de son support et remettez-la à la position de 115 volts indiquée sur le chassis.

Si le poste ne fonctionne pas dans une minute après avoir été connecté avec le courant continu, tournez la fiche en sens inverse, dans la prise du mur.

Ceci sera fait également si un bourdonnement se produit lorsque le poste fonctionne sur courant alternatif.

La consommation totale de puissance lorsque le poste est opéré sur 115 volts, est de 25 watts; et de 58 watts lorsqu'il fonctionne sur 230 volts.

Le débit de puissance maximum sur 115 volts est de 1,4 et sur 230 volts est de 3 watts.

AVIS

Des résistances spéciales peuvent être obtenues pour usage avec débits de puissance aux voltages suivants:

150 volts...Pièce No. 100-87
175 volts...Pièce No. 100-89
200 volts...Pièce No. 100-91

Ces tubes de résistance doivent être insérés de façon à ce que l'emboîture d'attache soit à la position de 220 volts ou le poste ne pourra pas être mis en jeu.

ANTENNE

Une bonne antenne est nécessaire pour obtenir une réception satisfaisante.

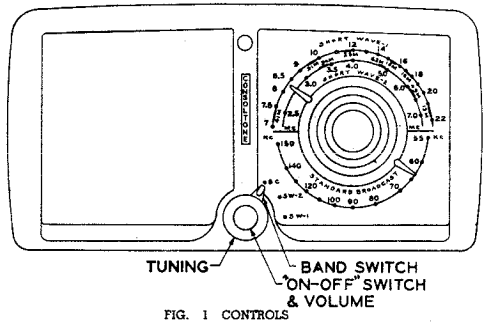

FIG. 1 CONTROLS

Une antenne extérieure de 40 à 60 pieds (13 à 20 mètres) de longueur et aussi éleveé que possible donnera de bons résultats pour l'usage général. Si vous devez employer votre antenne actuelle, examinez-la soigneusement afin d'en déterminer l'état. Les connections peuvent en être rouillées ou cassées, rendant l'antenne inutilisable. Si une nouvelle antenne doit être construite, soyez sûr

©John F. Rider

que el alambre de bajada no haga contacto con las paredes, árboles o cualquier otre objeto. Todas las conexiones deberán ser correctamente soldadas para evitar la oxidación y la producción de ruido consiguiente. Conéctese el extremo del alambre de bajada de la antena a la terminal azul en la parte posterior del chasis.

TIERRA

Una buena conexión a tierra mejorará efectivamente la recepción, aumentando la fuerza de las señales de las estaciones lejanas y reduciendo el ruido de fondo. La mejor conexión a tierra es un caño de 1.50 mt. introducido en tierra húmeda. El alambre a tierra debe ser soldado al caño o asegurado cuidadosamente con una buena grapa de toma de tierra, limpiando previamente con cuidado el caño en este punto. Una buena conexión a tierra puede obtenerse haciendo una buena conexión a un caño de agua o a un radiador. Conecte el extremo de la bajada a tierra a la terminal del alambre negro situado en la parte posterior del chasis.

PUESTA DEL RECEPTOR EN FUNCIONAMIENTO

Estudie la Figura 1. Esta indica la posición y finalidad de cada control. Girando hacia la derecha la perilla de la combinación "OFF-ON" y del control de volumen, el receptor se pondrá en funcionamiento (ON), encendiéndose una luz piloto, roja. Se requiere aproximadamente 30 segundos para que los tubos se calienten a la temperatura de funcionamiento. Continuando la rotación de esta perilla a la derecha, aumenta el volumen. Girando esta perilla hacia la izquierda disminuye el volumen, y cuando se oye un ruido "clic" se desconecta el receptor. Cuando se está sintonizando una estación, gire la perilla de sintonización lentamente hacia la estación deseada. Deberá ponerse cuidado para sintonizar el receptor de-

the antenna lead-in to the blue lead at the back of the chassis.

GROUND

A good ground will aid reception materially by improving the signal strength of distant stations and reducing background noise. The best ground is a 4 to 6 foot pipe driven in moist earth. The ground wire should be soldered to the pipe or fastened securely with a good ground clamp, first thoroughly cleaning the pipe at that point.

A suitable ground may also bo obtained by making a good obtained by making a good connection to a water pipe or radiator. Connect the ground lead-in to the black wire at the rear of the chassis.

PLACING THE RECEIVER IN OPERATION

Study Figure 1. This shows the position and purpose of each control. Turning the combination "OFF-ON" switch and volume control to the right will turn the receiver ON and a red pilot will light up. Approximately 30 seconds will be required for the tubes to heat to operating temperature. Continued rotation of this knob to the right increases the volume. Turning this control to the left decreases the volume and, when a click is heard, turns the receiver OFF.

When tuning in a station turn the tuning knob slowly to the desired station. Care should be taken to tune the receiver properly, otherwise the tone will be impaired.

The receiver has three tuning ranges, any one of which may be selected by means of the band switch. The band in use will be indicated by the band switch lever pointing to one of three white dots marked BC, SW-2 and SW-1 on the dial face.

Daylight has a decided effect on the reception of short wave

que le fil de prise de terre ne fasse pas contact dans un arbre, un mur ou un fossé et que toutes les connections soient soudées convenablement afin d'éviter la rouille et les bruits parasites qui en sont le résultat. Attachez le fil d'entrée de l'antenne au terminal bleu au dos du chassis.

PRISE DE TERRE

Une bonne prise de terre favorisera beaucoup la réception en renforçant la puissance des signaux des stations éloignées et en diminuant les bruits parasites. La meilleure prise de sol se fait au moyen d'un tuyeau de 4 à 6 pieds (1,5 mètres) de longueur, placé dans une terre humide. Le fil de prise de terre devra être soudé au tuyeau ou attaché bien solidement avec un bon crampon de sol, le tuyeau ayant été nettoyé soigneusement à cet endroit au préalable.

Une bonne prise de terre peut aussi être effectué en attachant soigneusement le fil de prise de terre à un tuyeau d'eau ou à un radiateur. Attachez le fil d'entrée au terminal noir au dos du chassis.

MISE EN FONCTION

Etudiez la figure 1. Elle démontre la position et le rôle de chaque bouton de contrôle. Tournez le commutateur combinaison "Off-On" et le bouton de commande de volume vers la droite et le poste sera mis en fonction et allumera la lampe-pilote rouge. Environ 30 secondes seront nécessaires pour chauffer les tubes à la température d'opération. Pour augmenter le volume, continuez de tourner le bouton vers la droite. Si vous le tournez vers la gauche, le volume diminuera et pour cesser la réception, continuez de tourner vers la gauche jusqu'à la production d'un déclic.

Pour syntoniser une station, tournez lentement le bouton d'accord jusqu'à la station désirée. L'accord doit être mis au point soigneusement, autrement la qualité du son s'en ressentira.

Le poste a trois gammes d'accord, dont on peut choisir

bidamente, de lo contrario se desmejorará el tono.

El receptor tiene tres escalas de sintonización, pudiendo seleccionarse cualquiera por medio de una perilla de escalas. La escala en uso estará indicada por el indicador de la perilla de escala señalando a uno de los puntos blancos marcados BC, SW-2 y SW-1 en la superficie del dial.

La luz del día tiene una decidida influencia sobre la recepción de las estaciones de onda corta, teniendo las diferentes longitudes de onda mayor eficacia a distintas horas del día. El cuadro a la derecha puede ser usado como guía.

VALVULAS

En este aparato se emplean las siguientes válvulas:

12SA7GT	35L6GT
12SK7GT	35Z5GT
12SQ7GT	100-85

La Figura 2 indica la situación correcta del porta-válvula para cada válvula.

stations and different wave lengths are most effective at different times of the day. The table below may be used as a guide.

SHORT WAVE BAND	TIME OF BEST RECEPTION
16 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

TUBES

The following tubes are used in this set:

12SA7GT	35L6GT
12SK7GT	35Z5GT
12SQ7GT	100-85

Figure 2 shows the correct socket location for each tube.

n'importe laquelle au moyen du commutateur de bande. La bande en usage sera indiquée par l'aiguille de repère du commutateur de bande, indiquant l'un des trois points blancs marqués BC, SW-2 et SW-1 sur le cadran.

La lumière du jour joue un rôle incontestable quant à la réception des stations à ondes courtes; et les différentes longueurs d'ondes sont mieux reçues à des heures différentes. La table à la gauche peut être employée comme guide.

TUBES

Les tubes suivants sont employés avec cet appareil:

12SA7GT	35L6GT
12SK7GT	35Z5GT
12SQ7GT	100-85

La figure 2 montre la position correcte du support de chaque tube.

INSTRUCCIONES PARA LA INSTALACION Y FUNCIONAMIENTO

INFORMACION GENERAL

Después de desembaiar el receptor, el papel engomado usado en embalaje y embarque, tiene que quitarse del chasis. La tabla de montajé, usada solamente en los receptores con gabinetes de material plástico, puede removerse siguiendo las instrucciones que se encuentran sobre dicha tabla. Radios con gabinetes de madera no requieren una tabla de montaje, y están listos para funcionar después de quitar el papel engomado.

Este receptor es un moderno aparato superheterodino, de seis válvulas, incluyendo una reguladora, que sintoniza las bandas de onda larga y corta, como sigue: 540 a 1660 Kc. (555 a 180 metros), 2100 a 7300 Kc. (143 a 41 metros), 6800 a 22,500 Kc. (44 a 13.3 metros) y una gama de ondas especial desde 9400 a 12,200 Kc. (31.9 a 24.6 metros) con ensanchamiento de banda en 25 y 31 metros.

Está equipado con altoparlante electrodinámico y un regulador de tono de dos posiciones.

SUMINISTRO DE ENERGIA

El receptor puede ser usado con corriente alternada (C.A.) de 50 á 60 períodos o con corriente contínua (C.C.). Sale de la fábrica ajustado para uso con 230 voltios y puede ser reajustado para funcionar con corriente de 115 voltios, removiendo el tornillo de cierre en la válvula reguladora ("Ballast"), quitando el tubo de su zócalo y volviendo a insertar este en el zócalo en la posición de 115 voltios tal como está indicado en el mismo.

Si el receptor no funciona después de estar conectado a la corriente contínua durante un minuto, el tomacorriente tiene que ponerse en posición opuesta en el enchufe. Este procedimiento tiene que seguirse también, si se siente un zumbido cuando el receptor está funcionando sobre corriente alternada.

El consumo total de energía cuando está operando en 115 voltios, es de 26 vatios, y cuando está operando en 230 de 60 vatios. La potencia de salida máxima en 115 voltios es de 2.1 vatios, y en 230 voltios es de 4.25 vatios.

Cuando se requiera, podemos suministrar tubos de resistencia especiales para funcionamiento con corrientes otras que de 115 ó 230 voltios, como sigue:

150 voltios—No. de ref. 100-87
175 voltios—No. de ref. 100-89
200 voltios—No. de ref. 100-91

Los tubos de resistencia deben colocarse en la posición de 230 voltios. De otra manera, el receptor no funcionará.

ANTENA

Una buena antena es indispensable para la recepción de radio y mientras más cuidadosa sea la instalación mejores serán

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

After the receiver has been unpacked from the carton, the paper tape used for packing and shipping must be removed from the chassis. The mounting board, used only on receivers with plastic cabinets, may be removed by following the instructions placed on the board. Radios with wooden cabinets do not require a mounting board; they are ready for operation after removing the paper tape.

This receiver is a modern six tube (including ballast) superheterodyne, tuning over the following standard broadcast and short-wave bands: 540 to 1660 Kc (555 to 180 meters), 2100 to 7300 Kc (143 to 41 meters), 6800 to 22,500 Kc (44 to 13.3 meters), and a special range covering 9400 to 12,200 Kc (31,9 to 24.6 meters) with spread bands at 25 and 31 meter.

It is equipped with an electrodynamic speaker and a two position tone control.

POWER SUPPLY

The receiver may be used on either alternating current (A. C.) or 50 to 60 cycles or direct current D.C.) It leaves the factory adjusted for use on 230 volt power supply and may be readjusted to operate on 115 volt power lines by first removing the locking screw on the ballast tube, removing the tube from its socket, and reinserting in the socket in the 115 volt position as indicated on the socket.

If the receiver does not operate within one minute when connected to direct current, the power plug should be reversed at the wall socket. This procedure should also be followed if a hum is apparent when the receiver is operated on alternating current.

The total power consumption when operated on 115 volts is 26 watts, and when operated on 230 volts, 60 watts.

The maximum power output on 115 volts is 2.1 watts and on 230 volts is 4.25 watts.

Special ballast tubes are available for operation with mains other than 115 or 230 volts. They are as follows:

150 Volt....Part No. 100-87
175 Volt....Part No. 100-89
200 Volt....Part No. 100-91

These ballast tubes must be inserted so the hold-down bracket is in the 230 volt position; otherwise the receiver will not operate.

ANTENNA

A good antenna is necessary for satisfactory reception, and is well worth the effort expended in its construction. An outside antenna from 40 to 60 feet in length and as high as possible will give good all-around results. If your present antenna is to be used, a thorough examination should be made to determine its condi-

LES INSTRUCTIONS POUR L'INSTALLATION ET LE FONCTIONNEMENT

GENERAL

Après déballage du récepteur de la boite en carton, la bande de papier-cache employée pour l'emballage et l'expédition doit être enlevée du châssis. Le panneau de montage, usé seulement avec des récepteurs avec meubles en matière plastique, peut être enlevé en suivant les instructions données sur le panneau. Les récepteurs de TSF avec meubles en bois n'ont pas besoin d'un panneau de montage; ils sont prêts à fonctionner après que la bande de papier-cache a été enlevée.

Le present poste est un récepteur superhétérodyne moderne à six lampes, compris la lampe ballaste, dont l'accord englobe les bandes standard suivantes d'ondes moyennes et d'ondes courtes: 540 à 1660 Kc. (555 à 180 mètres), 2100 à 7300 Kc. (143 à 41 mètres), 6800 à 22,500 Kc. (44 à 13.3 mètres), et une échelle spéciale qui couvre de 9400 à 12,200 Kc. (31.9 à 24.6 mètres) avec épanouissement des bandes à 25 et 31 mètres.

Il est équipé d'un haut-parleur électrodynamique et d'une commande de ton a deux positions.

ALIMENTATION DE COURANT

On peut user le poste récepteur dans le courant alternatif (C.A.) 50 à 60 périodes ou le courant continu. (C.C.) Il est sorti de l'usine réglé pour fonctionner sur une provision d'énergie de 230 volts, et on peut rajuster pour l'opération sur courant de 115 volts en enlevant d'abord la vis de blocage dans la lampe ballaste, enlevant la lampe de sa douille, et remplaçant dans la douille dans la position 115 volts comme indiqué dans la douille.

Si le poste récepteur n'opère pas en dedans d'une minute quand il est relié au courant constant, on devrait renverser la prise de courant à la douille dans le mur. On devrait adapter cette procédure aussi si un murmure est apparent quand le poste récepteur est opéré dans le courant alternatif.

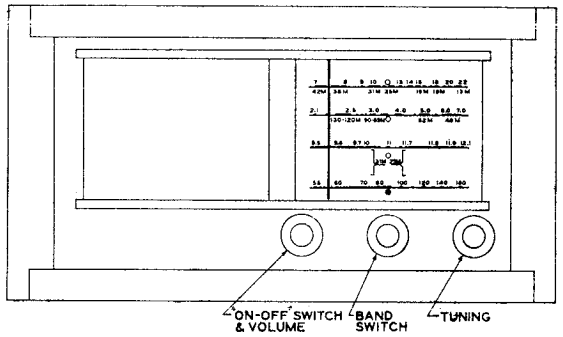

FIG. 1—CONTROLS

La consomption totale d'énergie quand en opération dans 115 volts est 26 watts, et quand en opération dans 230 volts est 60 watts.

Le maximum rendement d'énergie dans 115 volts est 2.1 watts et dans 230 volts est 4.25 watts.

Des valves spéciales (valves de résistance) sont disponibles pour des réseaux autres que de 115 ou 230 volts, comme suit:

150 volts—Pièce No. 100-87
175 volts—Pièce No. 100-89
200 volts—Pièce No. 100-91

Ces valves de résistance doivent être insérées de manière que la barre de serrage se trouve en position de 230 volts, autrement le récepteur ne fonctionnera pas.

©John F. Rider

los resultados. Una antena exterior de 13 a 20 metros instalado lo más alto posible es la más apropiada para uso general. Si se ha de usar una antena ya instalada, ésta debe examinarse minuciosamente para determinar su estado pues puede haber conexiones óxidadas o rotas, que nulifican la eficacia de la antena. Por otra parte si ha de instalarse una antena nueva hay que tomar las precauciones necesarias para que el alambre de bajada no haga contacto con la pared o con cualquier objeto que resulte en una conexión a tierra. Todas las conexiones deben estar correctamente soldadas para prevenir contra la oxidación y los ruidos que se producen a consecuencia de esto. Conéctese el alambre de bajada de la antena a la terminal marcada "A" en la parte trasera del chasis.

TIERRA

Una conexión a tierra bién hecha mejorará considerablemente la recepción aumentando la fuerza de las señales de estaciones lejanas y reduciendo el ruido de fondo. La conexión tierra más satisfactoria consiste en una sección de tubería de un metro a 1.50 metros de largo, colocada verticalmente y casi cubierta de tierra húmeda; un extremo de la conexión a tierra se conecta a la terminal marcada "G" en el chasis.

FUNCIONAMIENTO

(Véase la fig. 1). El grabado indica la posición y propósito de cada parilla. Haciendo girar la perilla combinada interruptor (OFF-ON) y regulador de volumen hacia la derecha, el receptor empieza a funcionar. Las válvulas requieren un minuto más o menos para calentarse. Para aumentar el volumen es necesario girar la perilla hacia la derecha. El volúmen se reduce haciendo girar la perilla hacia la izquierda y el receptor se apaga cuando se oye el ruido del interruptor.

Para sintonizar una estación gírese la perilla selectora hasta que la aguja indique la frecuencia deseada. La sintonización debe hacerse en el centro exacto de la señal para obtener los resultados. Una antena exterior de 13 a 20 metros instalado lo más alto posible es la más apropiada para uso general. Para sintonizar una estación gírese la perilla selectora hasta que la aguja indique la frecuencia deseada. La sintonización debe hacerse en el centro exacto de la señal para obtener

tion, as the connections may be corroded or broken, thus rendering the antenna unfit for service. If a new antenna is to be constructed, care should be taken to prevent the lead-in wire from grounding to trees, walls or gutters and all connections should be properly soldered to prevent corrosion and resulting noise. Connect the antenna lead-in to the post marked "A" at the back of the chassis.

GROUND

A good ground will aid reception materially by improving the signal strength of distant stations and reducing background noise. The best ground is a 4 to 6 foot pipe driven down to damp earth; the ground lead-in should be securely soldered to this.

A suitable ground may be obtained by making a good connection to a water pipe or radiator. Connect the ground lead-in to the post marked "G" at the rear of the chassis.

PLACING THE RECEIVER IN OPERATION

Note Fig. 1. This shows the position and purpose of each control. Turning the combination "Off-On" switch and volume control to the right will turn the receiver ON. Approximately one minute will be required for the tubes to heat to operating temperature. Continued rotation of this knob to the right increases the volume. Turning this control to the left decreases the volume and, when a click is heard, turns the receiver OFF.

When tuning in a station turn the tuning knob slowly to the desired station. Care should be taken to tune the receiver to the exact middle of the wave; otherwise the tone will be impaired.

The tone may be changed by means of the switch at the back of the radio from "High" to "Low."

The receiver has four tuning scales, any one of which may be selected by means of the

ANTENNE

Une bonne antenne s'impose pour obtenir une réception satisfaisante, et vaut bien l'effort nécessaire pour sa construction. Une antenne extérieure de 13 à 20 mètres de long et placée aussi haut que possible donnera d'excellents résultats pour tout service. Si vous vous proposez d'utiliser votre antenne actuelle, il conviendra d'en faire un examen approfondi pour en déterminer l'état car les connexions peuvent en être rouillées ou rompues, ce qui rendrait l'antenne impropre à l'emploi. Si on décide de construire une nouvelle antenne, il convient de veiller á ce que le fil d'entrée ne rejoigne pas la terre par des arbres, des murs ou des gouttières, et toutes les connexions devront être soudées avec soin pour prévenir la corrosion et les parasites qui en résulteraient. Reliez le fil d'entrée de l'antenne au montant marqué "A" à l'arriére du châssis.

PRISE DE TERRE

Une bonne prise de terre aidera notablement la réception en améliorant la force du signal pour les stattions distantes et en réduisant le bruit de fond. La meilleure prise de terre consiste d'un tuyau de 1 à 1.50 mètres qu'on enfonce dans le sol humide; la prise de terra devra y être solidement soudé.

On peut réaliser une prise de terre convenable en établissant une bonne connexion au tuyau d'eau ou à un radiateur. Reliez la prise de terre au montant marqué "G" à l'arrièrre du châssis.

MISE DU RECEPTEUR EN SERVICE

Notez la figure 1. Elle montre la position et l'objet de chaque contrôle. En tournant le commutateur combinaison interrupteur "OFF-ON" et contrôle du volume, vers la droite, le récepteur sera mis en circuit. Il faut compter environ 1 minute pour que les lampes se chauffent à la tempèrature de fonctionnement. En continuant de tourner ce bouton vers la droite, le volume augmente en intensité. En tournant ce même contrôle vers la gauche, on diminue le volume de so-

la mejor calidad de tono posible.

El tono se cambia por medio de un interruptor en la parte atrás del receptor, de "High" (alto) a "Low" (bajo).

El receptor tiene cuatro gamas de onda, y cualquiera de ellas puede seleccionarse por medio del conmutador de bandas. La banda que se esté usanda estará indicada por medio de un punto rojo en el centro de la escala correspondiente.

La luz del día tiene una decidida influencia sobre la recepción de la onda corta y diferentes longitudes de onda alcanzan mayor eficacia a diferentes horas del día. El cuadro a la derecha puede ser usado como guía para sintonizar a diferentes horas del día y la noche.

VALVULAS

Este receptor usa las válvulas siguientes:

14Q7 – 7B7 – 7C6 – 50C6G – 35Z5GT – 100-85. OR 50L6GT

La fig. 2 muestra la posición de las válvulas.

FONOGRAFO

Este receptor está equipado con un "jack" y una ficha de fonógrafo situada en la parte posterior del chasis. Para utilizar el receptor con un tocadiscos, coloque el conmutador de bandas en una de las bandas de onda corta y controle el volumen de la producción del disco con el Control de Volumen del receptor.

band switch. The scale in use will be indicated by a red dot in the center of the corresponding scale.

Daylight has a decided effect on the reception of short wave stations and different wave lengths are most effective at different times of the day. The following table may be used as a guide.

SHORT WAVE BAND	TIME OF BEST RECEPTION
16 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

TUBES

The following tubes are employed in this receiver.

14Q7 – 7B7 – 7C6 – 50C6G – 35Z5GT – 100-85. OR 50L6GT

Figure 2 shows the correct socket for each tube.

PHONO

This receiver is equipped with a phono jack and plug located on the rear of the chassis. To use the receiver with a record player, set the Band Switch to one of the short wave bands and control the volume of the record reproduction with the receiver Volume Control.

norité et, quand on entend un léger clic, c'est qu'on a mis le récepteur hors circuit.

Quand vous accordez une station, tournez le bouton de syntonisation lentement jusqu'a ce que vous ayez obtenu la station désirée. Il convient de veiller à accorder le poste exactement au milieu de la longueur d'onde correspondante; autrement le ton en sera affecté.

Le ton peut être modifié au moyen du commutateur qui se trouve à l'arrière du poste, et cela de la position "High" (haut) à "Low" (bas).

Le récepteur possède quatre échelles d'accord parmi lesquelles on peut sélectionner l'une quelconque d'entre elles au moyen du commutateur sélectionneur de bandes. La bande en usage sera indiquée par un point rouge au centre de l'échelle correspondante.

La réception radiophonique sur ondes courtes est définitivement affectée par la lumière du jour et la réception sur différentes longueurs d'ondes est plus ou moins efficace à différents moments de la journée. Nous donnons à gauche un barème qui peut être suivi pour l'écoute des différentes stations pendant le jour ou la nuit.

LAMPES

Les lampes suivantes sont employées sur ce poste:

14Q7 – 7B7 – 7C6 – 50C6G – 35Z5GT – 100-85.

La figure 2 montre la douille correcte pour chaque lampe.

PHONO

Ce récepteur est muni d'un "Phono Jack" et d'un Fiche placés au dos du Chassis. Pour faire fonctionner l'appareil avec le gramophone placez le Commutateur de Bandes à l'une des bandes d'ondes courtes et contrôlez le volume du son du disque par le bouon de contrôle de volume du récepteur.

PHONO

Este receptor esta provisto de una conexión para el fonógrafo, y una clavija o toma, situadas en la parte posterior del chasis. Para usar el receptor con un "Tocadiscos," ajuste el cambio de banda a una de las bandas de onda corta y controle el volumen del sonido con el control de volumen del receptor.

PHONO

The Phono Jack and Plug is located on the rear of the receiver chassis. When using a record player with this receiver set the band switch to one of the short wave bands. Control the phono volume with the receiver Volume Control.

PHONO

Ce recepteur est pourvu d'une "Cheville de Phonographe" et une prise, qui se trouvent au dos du châssis. Pour employer le poste avec un appareil phonographique externe ("record player"), tournez le commutateur sélectionneur de bandes à une des bandes d'ondes courtes, et réglez le volume du son au moyen du controle du volume du poste.

INSTRUCCIONES PARA LA INSTALACION Y FUNCIONAMIENTO

INFORMACION GENERAL

Despues de desembalar el receptor el papel engomado usado en embalaje y embarque, tiene que quitarse del chasis.

Este receptor es un moderno aparato superheterodino, de cinco tubos, que sintoniza las bandas de onda larga y corta siguientes: 540 a 1660 Kc. (555 a 180 metros), 2100 a 7300 Kc. (143 a 41 metros), 6800 a 22,500 Kc. (44 a 13.3 metros) y una escala especial de ondas desde 9400 a 12,200 Kc. (31.9 a 24.6 metros) con ensanchamiento de banda en 25 y 31 metros.

SUMINISTRO DE ENERGIA

PRECAUCION! ESTE RECEPTOR NO DEBE CONECTARSE A CORRIENTE CONTINUA (C.C.)

El transformador de fuerza fué ajustado en la fábrica a un voltaje máximo, y puede ajustarse al voltaje deseado mediante el conmutador graduado que se encuentra en el transformador.

El chasís 5C63BT ha sido diseñado para funcionar con 115 ó 225 voltios, de 50 ó 60 períodos.

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

After the receiver has been unpacked from the carton, the paper tape used for packing and shipping must be removed from the chassis.

This receiver is a modern five tube superheterodyne, tuning over the following standard broadcast and short-wave bands: 540 to 1660 Kc. (555 to 180 meters), 2100 to 7300 Kc. (143 to 41 meters), 6800 to 22,500 Kc. (44 to 13.3 meters), and a special range covering 9400 to 12,200 Kc. (31.9 to 24.6 meters) with spread bands at 25 and 31 meters.

POWER SUPPLY

CAUTION: DO NOT CONNECT THIS RECEIVER TO DIRECT CURRENT (D.C.)

This radio was shipped from the factory with the power transformer adjusted for high voltage operation and may be changed for low voltage operation by means of the switch located on the power transformer.

The 5C63BT chassis is designed to operate on 115 or 225 volts, 50 to 60 cycles.

LES INSTRUCTIONS POUR LA INSTALLATION ET FONCTIONNEMENT

GENERAL

Après déballage du récepteur de la boite en carton, la bande de papier-cache employée pour l'emballage et l'expédition doit être enlevée du châssis.

Le présent poste est un récepteur superhétérodyne moderne à cinq lampes, dont l'accord englobe les bandes standard suivantes d'ondes longues et d'ondes courtes: 540 à 1660 Kc. (555 à 180 mètres), 2100 à 7300 Kc. (143 à 41 mètres), 6800 à 22,500 Kc. (44 à 1.3 mèters), et une échelle spéciale qui couvre de 9400 à 12,200 Kc. (31.9 à 24.6 mètres) avec épanouissement des bandes à 25 et 31 mètres.

ALIMENTATION DE COURANT

ATTENTION: NE PAS BRANCHER CE POSTE SUR COURANT CONTINU (C.C.)

Le poste a été expédié de l'usine avec son transformateur de courant réglé pour mise en service sur haut voltage et peut être changé pour emploi sur bas voltage au moyen du commutateur situé sur le transformateur de courant.

El chasís 5C63AT ha sido diseñado para funcionar con 115 ó 225 voltios, de 25 a 100 períodos.

El chasís 5C63CT ha sido diseñado para funcionar con 95, 115, ó 150 voltios, de 50 a 60 períodos.

Para cerciorarse de las características exactas del servicio eléctrico en su localidad, consulte a la Compañía de Luz Eléctrica o pregunte a su agente Zenith; ajústese el conmutador del transformador de fuerza al voltaje correcto si fuere necesario.

El consumo total de energía es de 40 vatios y la salida máxima es de 3.5 vatios.

The 5C63AT chassis is designed to operate on 115 or 225 volts, 25 to 100 cycles.

The 5C63CT chassis is designed to operate on 95, 115 or 150 volts, 50 to 60 cycles.

Ascertain your line voltage and frequency, preferably by consulting your dealer or local power company and if necessary reset the power switch to conform to the local power source.

Total power consumption is 40 watts. Maximum power output is 3½ watts.

ANTENNA

A good antenna is necessary for satisfactory reception. An outside antenna from 40 to 60 feet in length and as high as possible will give good all around results. If your present antenna is to be used, a thorough examination should be made to determine its condition, as the connections may be corroded or broken thus rendering the antenna unfit for service. If a new antenna is to be constructed, care should be taken to prevent the lead-in wire from grounding to trees, walls or gutters and all connections should be properly soldered to prevent corrosion and resulting noise. Connect the antenna lead-in to the post marked "A" at the back of the chassis.

Le châssis 5C63BT est prévu pour emploi sur courant de 115 ou 225 volts, 50 à 60 périodes.

Le châssis 5C63AT est prévu pour emploi sur courant de 115 ou 225 volts, 25 à 100 periodes.

Le châssis 5C63CT est prévu pour mise en service sur courant de 95, 115 ou 150 volts, 50 à 60 périodes.

Assurez-vous du voltage et de la fréquence de votre courant, de préférence en consultant votre revendeur ou votre compagnie électrique locale, et, s'il y a lieu, ajustez le commutateur de courant en conformité avec la source électrique locale.

La consommation total de courant est de 40 watts. Le débit maximum de courant est de 3½ watts.

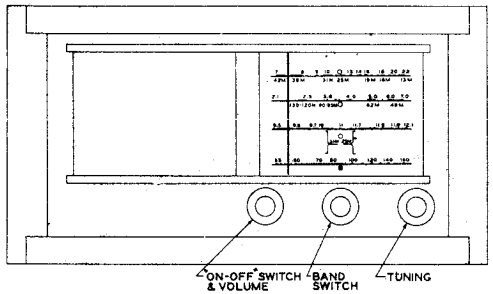

FIG. 1—CONTROLS

ANTENA

Una buena antena es indispensable para la recepción satisfactoria. Una antena exterior de 13 to 20 metros de longitud instalada lo más alto posible es la más apropiada para uso general. Si ha de usar una antena ya instalada, ésta debe examinarse minuciosamente para determinar su estado pues puede haber conexiones oxidadas o rotas, que nulifican la eficacia de la antena. Por otra parte si ha de instalarse una antena nueva hay que tomar las precauciones necesarias para que el alambre de bajada no haga contacto con la pared o con cualquier objeto

ANTENNE

Une bonne antenne s'impose pour obtenir une réception satisfaisante. Une antenne extérieure de 13 à 20 mètres de longueur et placée aussi haut que possible donnera d'excellents résultats pour tout service. Si vous vous proposez d'utiliser votre antenne actuelle il conviendra d'en faire un examen approfondi pour en déterminer l'état car les connexions peuvent en être rouillées ou rompues, ce qui rendrait l'antenne impropre à l'emploi. Si on décide de construire une nouvelle antenne, il convient de veiller á ce que le fil d'entrée ne rejoigne pas la terre par des arbres, des murs ou des gouttières, et toutes les connexions

©John F. Rider

que resulte en una conexión a tierra. Todas las conexiones deben estar correctamente soldadas para prevenir contra la oxidación y los ruidos que se producen a consecuencia de esto. Conéctese el alambre de bajada de la antena a la terminal marcada "A" en la parte trasera del chasis.

TIERRA

Una conexión a tierra bien hecha mejorará considerablemente la recepción aumentando la fuerza de las señales de estaciones lejanas y reduciendo el ruido de fondo. La conexión a tierra más satisfactoria consiste en una sección de tubería de un metro a 1.50 metros de largo, introducida verticalmente en tierra húmeda; un extremo de la conexión a tierra se conecta a la terminal marcada "G" en el chasis

FUNCIONAMIENTO

(Véase la fig. 1). El grabado indica la posición y propósito de cada perilla. Haciendo girar la perilla combinada del interruptor (ON-OFF) y regulador de volumen hacia la derecha, el receptor empieza a funcionar. Las válvulas requieren 30 segundos más o menos para calentarse. Para aumentar el volumen es necesario girar la perilla hacia la derecha. El volumen se reduce haciendo girar la perilla hacia la izquierda y el receptor se apaga cuando se oye el ruido del interruptor.

Para sintonizar una estación gírese la perilla selectora hasta que la aguja indique la frecuencia deseada. La sintonización debe hacerse en el centro de la frecuencia para obtener la mejor calidad de tono posible.

El tono se cambia por medio de un interruptor en la parte posterior del receptor, de "Alto" a "Bajo."

El receptor tiene cuatro escalas de onda, y cualquiera de ellas puede seleccionarse por medio del conmutador de bandas. La banda que se esté usando estará indicada por medio de un punto rojo en el centro de la escala correspondiente.

GROUND

A good ground will aid reception materially by improving the signal strength of distant stations and reducing background noise. The best ground is a 4 to 6 foot pipe driven down to damp earth; the ground lead-in should be securely soldered to this.

A suitable ground may be obtained by making a good connection to a water pipe or radiator. Connect the ground lead-in to the post marked 'G" at the rear of the chassis.

PLACING THE RECEIVER IN OPERATION

Note figure 1. This shows the position and purpose of each control. Turning the combination "ON-OFF" switch and volume control to the right will turn the receiver ON. Approximately 30 seconds will be required for the tubes to heat to operating temperature. Continued rotation of his knob to the right increases the volume. Turning this control to the left decreases the volume and, when a click is heard, turns the receiver OFF.

When tuning in a station turn the tuning knob slowly to the desired station. Care should be taken to tune the receiver to the middle of the signal; otherwise the tone will be impaired.

The tone may be changed by means of the switch at the back of the radio from "Treble" to "Bass."

If a hum is apparent, reverse the power plug in the wall outlet.

The receiver has four tuning ranges, any one of which may be selected by means of the band switch. The band in use will be indicated by a red dot in the center of the corresponding scale.

Daylight has a decided effect on the reception of short wave stations and different wave lengths are most effective at different times of the day. The following table may be used as a guide.

SHORT WAVE BAND	TIME OF BEST RECEPTION
16 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

VALVULAS

Este receptor usa las válvulas siguientes:

7Q7 6X5GT
7A7 6K6GT
6SQ7GT

La fig. 2 muestra la posición de las válvulas.

TUBES

The following tubes are employed in this receiver:

7Q7 6X5GT
7A7 6K6GT
6SQ7GT

Figure 2 shows the correct socket location for each tube.

PRISE DE TERRE

Une bonne prise de terre aidera notablement la réception en améliorant la force du signal pour les stations distantes et en réduisant le bruit de fond La meilleure prise de terre consiste d'un tuyau de 4 à 6 pieds qu'on enfonce dans le sol humide; la prise de terre devra y être solidement soudé.

On peut réaliser une prise de terre convenable en établissant une bonne connexion au tuyau d'eau ou radiateur. Connectez la prise de terre au montant marqué "G" à l'arrière du châssis.

MISE DU RECEPTEUR EN SERVICE

Notez la fig. 1. Elle montre la position et l'objet de chaque contrôle. En tournant le commutateur combinaison interrupteur "ON-OFF" et contrôle du volume, vers la droite, le recepteur sera mis en circuit. Il faut compter environ 30 secondes pour que les lampes se chauffent à la température de fonctionnement. En continuant de tourner ce bouton vers la droite, le volume augmente en intensité. En tournant ce même contrôle vers la gauche, on diminue le volume de sonorité et, quand on entend un léger clic, c'est qu'on a mis le récepteur hors circuit.

Quand vous accordez une station, tournez le bouton de syntonisation lentement jusqu'a ce que vous ayez obtenu la station désirée. Il convient de veiller à accorder le poste au milieu de la fréquence d'onde correspondante; autrement le ton en sera affecté.

Le ton peut être modifié au moyen du commutateur qui se trouve à l'arrière du poste, et cela de la position "Haut" à "Bas."

Le récepteur possède quatre échelles d'accord parmi lesquelles on peut selectionner l'une quelconque d'entre elles au moyen du commutateur sélectionneur de bandes. La bande en usage sera indiquée par un point rouge au centre de l'echelle correspondante.

La réception radiophonique sur ondes courtes est définitivement affectée par la lumière du jour et la réception sur différentes longueurs d'ondes est plus ou moins efficace à différents moments de la journée. Nous donnons à gauche un barème qui peut être suivi pour l'ecoute des différentes stations pendant le jour ou la nuit.

LAMPES

Les lampes suivantes sont employées sur ce poste:

7Q7 6X5GT
7A7 6K6GT
6SQ7GT

La figure 2 montre la douille correcte pour chaque lampe.

MODELS 6D014—6D029
CHASSIS No. 6C01

TO THE SERVICE MAN:

Chassis 6C01 features a high gain tuned R.F. circuit ahead of a conventional superheterodyne circuit, with feedback in the audio circuit, and a new filter circuit to reduce hum to a minimum.

Part of the audio voltage from the voice coil is fed back to the first audio grid(12SQ7) in phase through resistor R10 and R7 to a tap on the volume control R6. Capacitor C15 bypasses highs to ground. One side of the output transformer secondary is grounded. The side grounded determines the phase relationship of the feedback voltage, therefore, when replacing the output transformer be certain the proper end of the secondary is grounded or degeneration will result. The overall result of this arrangement is to boost the bass tones.

The filter circuits of chassis 6C01 incorporate new features that should be well understood by the service man. An examination of the schematic drawing will show the output transformer tapped slightly off center. This tap is the B+ connection from filter resistor R11 and capacitor C20 off the cathode of the rectifier 35Z5 to the 35L6 plate. The lower connection of the output transformer feeds B+ to the rest of the tubes in the receiver. Current flowing through the upper windings of the output transformer to the 35L6 produces a magnetic field which is 180° out of phase with the magnetic field produced by current flowing in the opposite direction through the output transformer to the rest of the receiver, therefore, most of the AC hum is cancelled. Further reduction of hum is accomplished by filtering through resistors R12 and R13 and capacitors C18 and C19.

This development in filtering systems allows a higher effective plate voltage on the 35L6 for increased power output.

NOTE: The output transformer must be replaced with an exact duplicate, Part No. 206-549 be sure to add the speaker code letter to the transformer Part Number.

DISTORTION AND POOR SENSITIVITY: Distortion and poor sensitivity caused by a short between turns on the wavemagnet.
Poor sensitivity and set fails to operate on low-frequency end of dial--replace oscillator coil.

UNCONTROLLED OSCILLATION: A 470,000 ohm resistor soldered across the secondary of the first i-f transformer will correct this condition.

For Alignment, see P.15-2

MODEL 6G001
CHASSIS No. 6C40

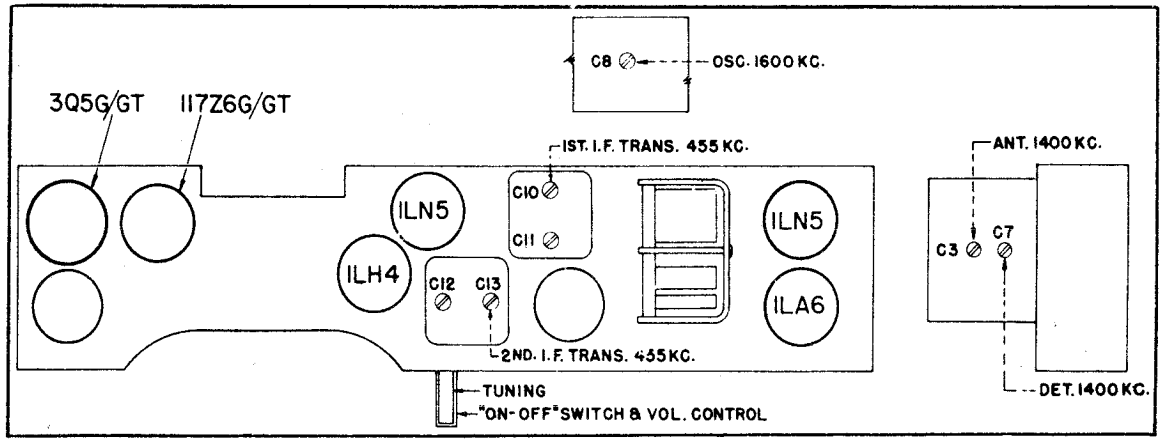
©John F. Rider

©John F. Rider

TO THE SERVICE MAN:

The 6C40 chassis is an AC, DC or battery operated superheterodyne circuit with a stage of RF amplification. The chassis is isolated from the DC circuit, and all measurements must be made from a common negative point. The most convenient place to reach this negative point is the terminal strip to which C5 is connected. The DC resistance from chassis to any circuit must be almost infinite. If any circuit becomes grounded a hum will appear. Microphonic tubes will cause audio howl. Check 1LA6.

The wavemagnet is connected to the chassis through the hinges in the cabinet, snaps and flexible leads. If the RF becomes weak or dead, check resistance of wavemagnet at condenser gang. The DC resistance across the two leads should be approximately 1 ohm. If the circuit is open, remove the two screws that hold the handle and top panel. When the top is removed, the wavemagnet connecting leads will be visible for inspection. Also loosen the snap-on socket and check for shorted or broken leads.



TUBE AND TRIMMER LOCATION

IF Alignment: Remove the chassis from the cabinet and arrange the units so that the wavemagnet can be plugged in. All the connections and adjustments can be made from the top of the chassis. Connect a signal generator, through a .1 mfd. dummy antenna, to the lug on top of the center section of the gang condenser (converter grid) and condenser gang frame. Connect an output meter across the voice coil of the speaker (two lugs provided). Set the signal generator to 455Kc. and adjust C10, C11, C12 and C13 for maximum indication on the output meter. Always keep the signal output from the generator just high enough to get an indication, otherwise excessive loading may result. Remove the signal generator leads from the gang.

RF Alignment: Connect a two turn loop across the leads of the signal generator, loosely couple this loop to the wavemagnet. Set the signal generator and the dial pointer of the receiver to 1600 Kc. and adjust C8 to resonance. Set the signal generator and dial pointer to 1400 and adjust C7 (detector) and C3 (RF) to resonance. These trimmers are on the side of gang condenser. Check operation and re-install set in cabinet. Tune in a weak station near 1400 Kc. or use background noise and readjust C3 through the hole in the side of the cabinet for maximum sensitivity.

ALIGNMENT PROCEDURE

Operation	Connect Osc. To	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Trimmers	Purpose
1	Converter Grid	.1 MFD	455KC	BC	600KC	C-10-11-12 13	IF alignment

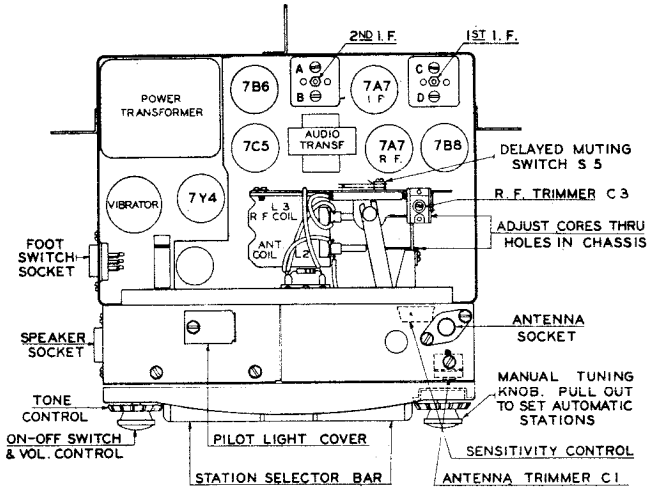

Fig. 7. Top View of Chassis

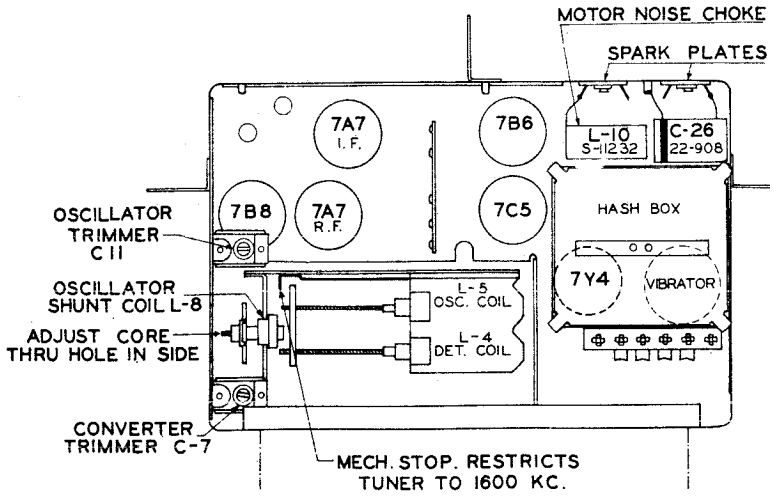

Fig. 8. Bottom View of Chassis

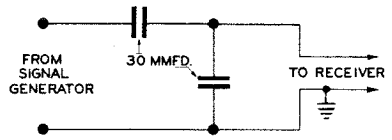

Fig. 9. Dummy Antenna

Fig. 9 shows the schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R.F. section of the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all alignment adjustments to the receiver with the volume control set at maximum, and the tone control in the treble position. Reduce the signal intensity as much as possible at the signal generator. Connect the output meter across the voice coil.

I.F. ALIGNMENT PROCEDURE

1—Remove top and bottom covers from receiver.

2—Set signal generator to 265 Kc.

3—Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)

4—Adjust I.F. trimmers A, B, C and D (Fig. 7) in the order named for maximum output. Repeat the operation to assure accurate alignment.

R.F. AND OSCILLATOR ALIGNMENT

1—Connect signal generator leads through dummy, illustrated in Fig. 9, to antenna lead in socket on receiver.

2—Set signal generator to 535 Kc.

3—Place set in manual tuning position and set dial to 535 Kc.

4—Adjust oscillator trimmer C-11 (Fig. 8) for maximum response.

5—Set signal generator to 1200 Kc.

6—Tune set to 1200 Kc.

7—Adjust converter trimmer C-7 (Fig. 8) and R.F. trimmer C-3 (Fig. 7) for maximum response.

8—If dial calibration is off after making above adjustments, a correction can be made by loosening dial scale mounting screws and sliding scale to desired position.

CORE OR COIL REPLACEMENT ONLY

WARNING: The following adjustments are to be made ONLY if a core or coil is replaced.

1—Replace coil or core.

2—Set signal generator to 1700 Kc.

3—Connect signal generator leads through dummy, illustrated in Figure 9, to antenna receptacle on the receiver.

4—Set receiver dial to 1600 Kc. (maximum high frequency end of dial.)

5—Screw the core completely out of the antenna coil, the R.F. coil, the converter coil, and the oscillator coil.

6—Adjust oscillator trimmer C-11 (Fig. 8) at 1700 Kc.

7—Adjust converter trimmer C-7, R.F. trimmer C-3, and antenna trimmer C-1 (Fig. 7 and 8) for maximum output reading.

8—Replace cores to their approximate original position.

9—Set generator dial and receiver dial to 1200 Kc.

10—Adjust oscillator core L-5 (Fig. 8) to scale at 1200 Kc.

11—Adjust the antenna core, R.F. core, and converter core (Fig. 7 and 8) for maximum output reading.

12—Set signal generator to 600 Kc.

3—"Rock in" shunt oscillator coil L-8 (Fig. 8) for maximum output reading. This should be done only as a last resort. This is the same as rocking in the padder condenser on a ganged condenser receiver.

14—Check receiver at 1200 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10 and 11.

15—After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc., the mechanical stop for the tuner cross arm should be bent to limit the frequency coverage to 1605 Kc.

After all adjustments have been made, glue core screws with speaker cement.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1200 Kc.

©John F. Rider

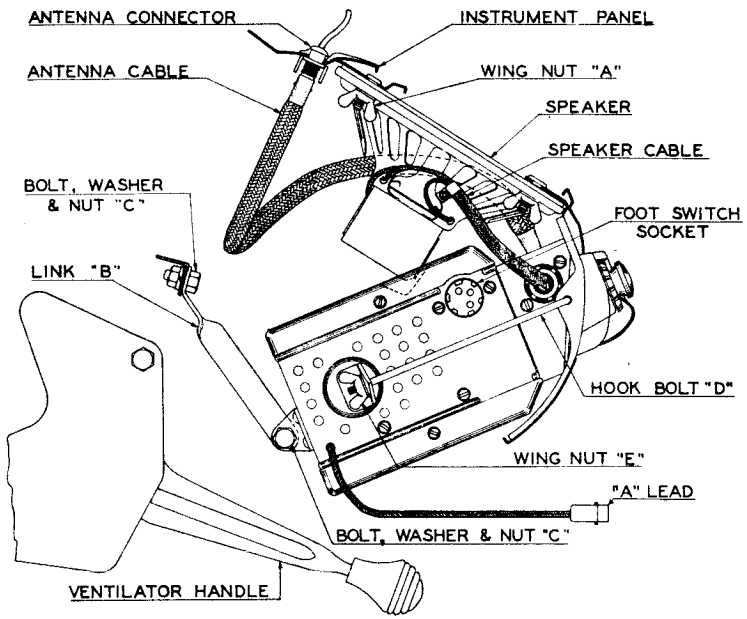

Fig. 1. Set Installed, Cut Away View.

RECEIVER INSTALLATION

Figures 1 and 2, illustrating the installed receiver, the escutcheon plate, and the control knobs, are given here to facilitate removal and reinstallation of this receiver when service or repair is necessary. To take the receiver from the car, remove the link "B" and loosen the hook bolts "D."

MANUAL TUNING

1. Press station selector touch bar (Fig. 2) several times or until the letter "M" appears in indicator window.
2. Pull manual tuning control knob (right hand) outward and turn to tune in desired station. Be sure to tune to exact frequency to assure the best tone quality.

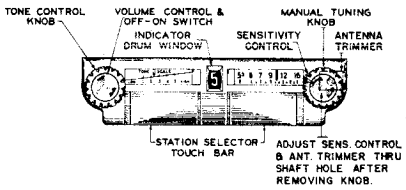
VOLUME—Adjust left hand control knob for desired volume.

TONE CONTROL—The tone control is located behind the volume control knob. Turn in either direction for most pleasing tone.

ADJUST-O-MATIC TUNING

There are five automatic tuning positions which may be adjusted to five desired stations. If these positions have not been previously adjusted proceed as follows:

1. Press station selector touch bar until number 1 appears in station indicator window.



TONE CONTROL KNOB
VOLUME CONTROL & OFF-ON SWITCH
INDICATOR DRUM WINDOW
MANUAL TUNING KNOB
SENSITIVITY CONTROL
ANTENNA TRIMMER
STATION SELECTOR TOUCH BAR
ADJUST SENS. CONTROL & ANT. TRIMMER THRU SHAFT HOLE AFTER REMOVING KNOB.

Fig. 2. Front Panel View

2. Pull manual tuning knob outward to engage the adjust-o-matic mechanism.
3. Select the station desired and tune to its frequency by turning the tuning knob. Tune very carefully for clearest reception.
4. Press station selector bar, pull manual tuning knob outward and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5.

When the five adjust-o-matic positions have been adjusted to the five desired stations as instructed, it is only necessary to press the station selector bar to return to dial tuning, or to only one of the stations set up on the Adjust-o-Matic.

DELAYED AUTOMATIC MUTING CIRCUIT

Pressing either the touch-bar or the foot control switch automatically mutes the receiver for the duration of the change cycle. This action is accomplished by applying 6 volts negative to the 7B6 first audio grid through the 1 megohm resistor R-21. (See schematic diagram.) This negative voltage blocks the grid of the 7B6 until the voltage bleeds off through the 15 megohm resistor R-14. Then the receiver will again operate normally.

NOTE: If the battery polarity is reversed the receiver will not mute and it may become distorted during the change cycle. Always connect the positive (+) terminal of the storage battery or power supply to the receiver case when checking the receiver.

INTERFERENCE SUPPRESSION

There should be no motor noise or interference from the ignition system if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

The circuit breaker condenser No. 22-1148 should be installed as shown in Figure 3.

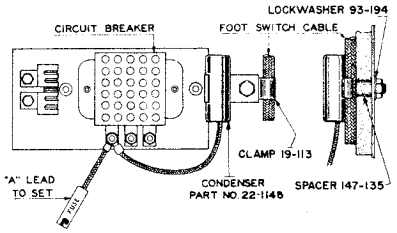


Fig. 3

The voltage regulator condenser No. 22-1148 and the ground strap should be installed as shown in Figure 4 below.

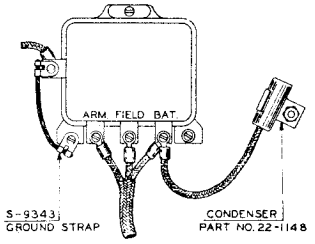

Fig. 4

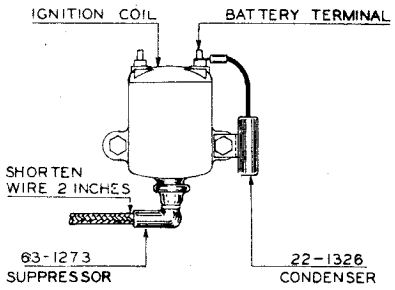

Fig. 5

The ignition coil condenser No. 22-1326 and suppressor with rubber nipple No. S-10408 should be installed as shown above in Figure 5. The oil gauge condenser No. 22-1326 should be installed as shown in Figure 6. Note the different locations for 6 and 8 cylinder cars.

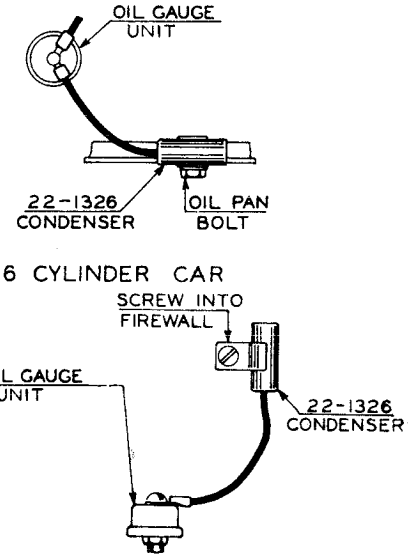

Fig. 6

Be sure the inside windshield divider trim strip, the antenna connector and all the instrument panel bolts are tight in order to make a good ground contact with the car body.

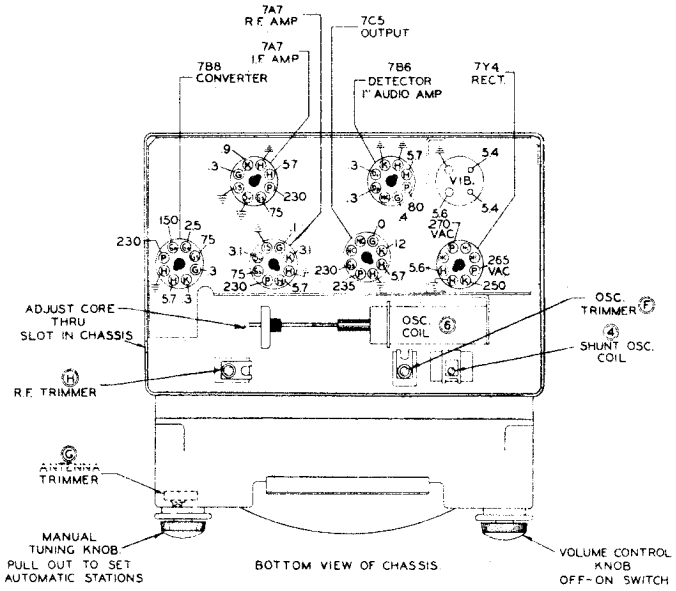

FIG. 8

Figure 8 shows the approximate voltages as measured with a 1000 ohm per volt meter measured between the socket terminals and the chassis. Volume control set at maximum with no signal. Battery Voltage—6.3.

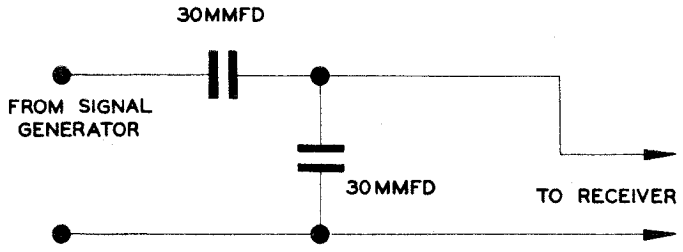

FIG. 9

Schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R. F. section of the receiver.

IMPORTANT: When reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature before checking the antenna trimmer alignment on a weak station at approximately 1200 Kc.

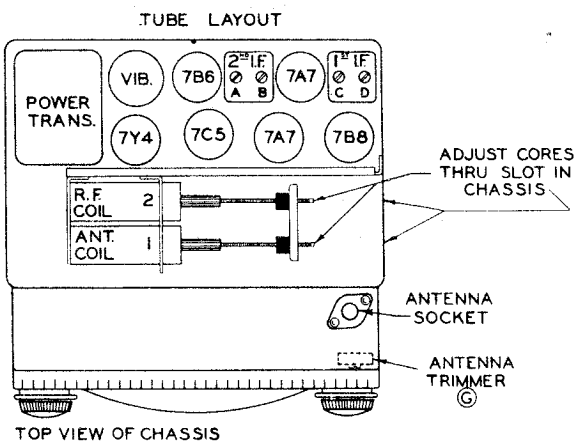

FIG. 7

Maximum performance is dependent upon the accurate alignment of the receiver, so follow the alignment instructions carefully.

CAUTION: Make all alignment adjustments to the receiver with the volume control turned full on. Reduce the signal intensity, if necessary, at the signal generator. Connect the output meter across the voice coil

I.F. ALIGNMENT PROCEDURE

1—Remove the top and bottom covers from the receiver.

2—Place the receiver in the Manual tuning position and set the pointer at the low frequency end of the dial. (540 Kc.)

3—Set the signal generator at 265 Kc.

4—Apply the signal from the generator through a .1 mfd. dummy to the 7B8 converter grid.

5—Adjust trimmers A-B-C and D (Fig. 7) for maximum output. Repeat the operation to assure accurate alignment.

R. F. AND OSCILLATOR ALIGNMENT

1—Set the signal generator at 1640 Kc.

2—Connect the signal generator leads, through the dummy as illustrated in Figure 9, to the antenna receptacle on the receiver.

3—Set the receiver dial at 1640 Kc. (Maximum high frequency end of dial.)

4—Screw the cores completely out of the antenna, R.F. and oscillator coils.

5—Set the oscillator trimmer (F—Fig. 8) at 1640 Kc.

6—Peak the R.F. and antenna trimmers (G and H—Fig. 8) for maximum output reading.

7—Replace the cores to their approximate original positions in the antenna, R.F. and oscillator coils.

8—Set the generator and the receiver dial at 1200 Kc.

9—Adjust the oscillator core (6—Fig. 8) to scale at 1200 Kc.

10—Adjust the antenna and R.F. cores (1 and 2—Fig. 7) for maximum output reading.

11—Set the signal generator at 600 Kc.

12—"Rock in" the Shunt oscillator core (4—Fig. 8) for maximum output reading. (Same as rocking in the padder condenser on a ganged condenser receiver.)

13—Check the receiver at 1200 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9 and 10.

©John F. Rider

RECEIVER INSTALLATION:

Figures 1 and 2, illustrating the escutcheon plate, control knobs and the installed receiver are given here to facilitate removal and reinstallation of the receiver when service or repairs are necessary.

Remove the Link "B" and loosen the hook bolts "D" to remove the receiver from the car.

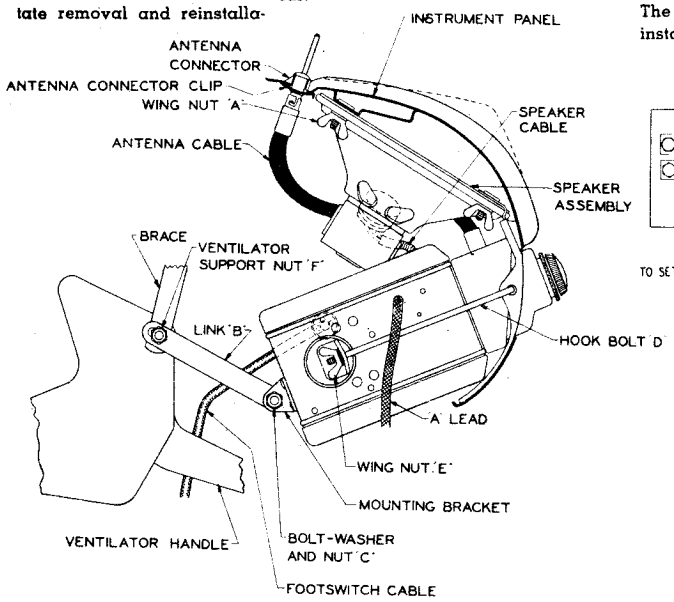

FIG. 1

FIG. 2

INTERFERENCE SUPPRESSION

There should be no motornoise or interferences from the ignition circuit, if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

The circuit breaker condenser No. 22-1148 should be installed as shown in Figure 3.

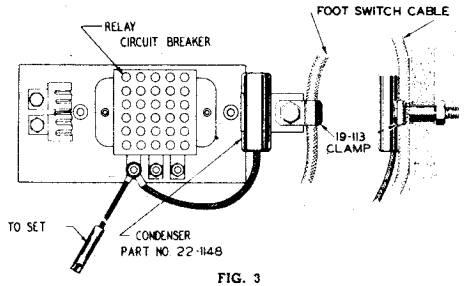

FIG. 3

NOTE: To set up a station on any automatic position, pull the tuning knob out and tune the receiver as in manual tuning. Press the tuning knob in to its original position after the station has been accurately tuned in.

The voltage regulator condenser No. 22-1148 and the ground strap No. S-9343 should be installed as shown in Figure 4 below.

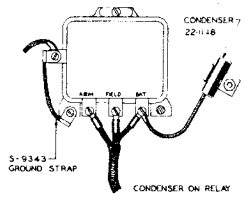

FIG. 4

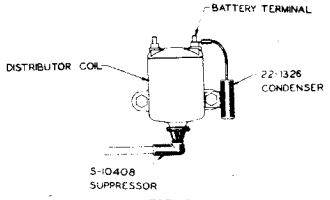

FIG. 5

The distributor primary condenser No. 22-1326 and suppressor with rubber nipple No. S-10408 should be installed as shown above in Figure 5.

The oil gauge condenser No. 22-1326 should be installed as shown in Figure 6.

Note the different locations for 6 and 8 cylinder cars.

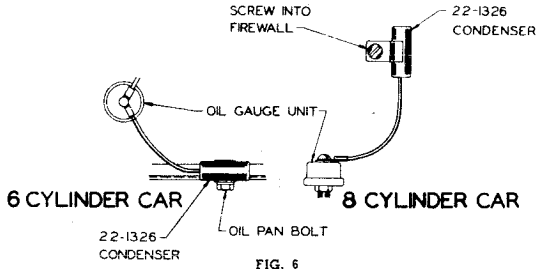

FIG. 6

Check the inside windshield divider trim strip, the antenna connector, and all the instrument panel bolts so they make a good ground contact with the body.

DELAYED AUTOMATIC MUTING CIRCUIT

Pressing either the Touch-bar or the foot control switch automatically mutes the receiver for the duration of the change cycle. This action is accomplished by applying 6 volts negative to the 7B6 first audio grid through the 1 megohm resistor R-14. (See schematic diagram.) This negative voltage blocks the grid of the 7B6 until the voltage bleeds off through the 15 megohm resistor R-13, when the receiver will again operate normally. NOTE: The storage battery in the car must be properly polarized to apply the negative muting voltage to the receiver. If the battery polarity is reversed the receiver will not mute and it may become distorted during the change cycle. Always connect the positive (+) terminal of the storage battery or power supply to the receiver case when checking the receiver.

DELAYED AUTOMATIC MUTING CIRCUIT

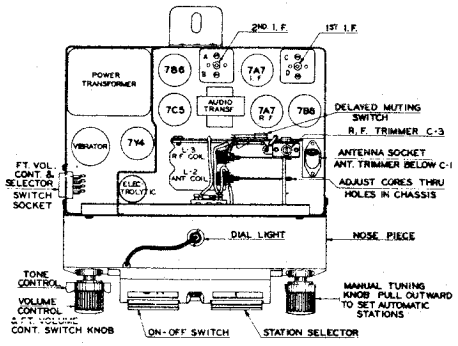

Fig. 10. Top View of Chassis.

Pressing either the Push-bar or the foot control switch automatically mutes the receiver for the duration of the change cycle. This action is accomplished by applying 6 volts negative to the 7B6 first audio grid through the 1 megohm resistor R-22. (See schematic diagram.) This negative voltage blocks off the grid of the 7B6 until the voltage bleeds off through the 15 megohm resistor R-14. Then the receiver will again operate normally. NOTE: If the battery polarity is reversed the receiver will not mute and it may become distorted during the change cycle. Always connect the positive (+) terminal of the storage battery or power supply to the receiver case when checking the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all adjustments on the receiver with volume control turned full on and foot volume control cable plugged into its socket. Reduce signal intensity as much as possible at signal generator. Connect output meter across voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 265 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C, and D (Fig. 10), in the order named for maximum output. Repeat the operation to assure accurate alignment.

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy illustrated in Fig. 12 to antenna lead in socket on receiver.
2. Set signal generator to 535 Kc.
3. Place set in manual tuning position and set dial to 535 Kc.
4. Adjust oscillator trimmer C-11 (Fig. 11), for maximum response.

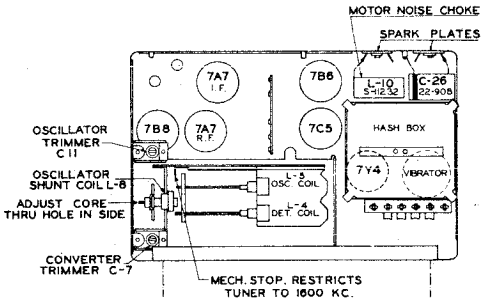

Fig. 11. Bottom View of Chassis.

5. Set signal generator to 1200 Kc.
6. Tune set to 1200 Kc.
7. Adjust converter trimmer C-7 (Fig. 11) and R.F. trimmer C-3 (Fig. 10) for maximum response.
8. If dial calibration is off after making above adjustments, a correction can be made by loosening dial scale mounting screws and sliding scale to desired position.

CORE OR COIL REPLACEMENT ONLY

WARNING: The following adjustments are to be made ONLY if a core or coil is replaced.

1. Replace coil or core.
2. Set signal generator to 1700 Kc.
3. Connect signal generator leads through dummy illustrated in Figure 12 to antenna receptacle on the receiver.
4. Set receiver dial to 1600 Kc. (Maximum high frequency end of dial.)
5. Screw the core completely out of the antenna coil, the R. F. Coil, the converter coil, and the oscillator coil.
6. Adjust oscillator trimmer C-11 (Fig. 11), at 1700 Kc.
7. Adjust converter trimmer C-7, R.F. trimmer C-3, and antenna trimmer C-1 (Fig. 10 and 11) for maximum output reading.
8. Replace cores to their approximate original positions
9. Set generator dial and receiver dial to 1200 Kc.
10. Adjust oscillator core (Figure 10) to scale at 1200 Kc.
11. Adjust the antenna core, R.F. core, and converter core (Fig. 10 and 11), for maximum output reading.
12. Set signal generator to 600 Kc.
13. "Rock in" shunt oscillator coil (Fig. 10) for maximum output reading. (This should only be done as a last resort.) This is the same as rocking in the padder condenser on a ganged condenser receiver.
14. Check receiver at 1200 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10 and 11.
15. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc. the mechanical stop for the tuner cross arm should be bent to limit the frequency coverage to 1605 Kc.

After all adjustments have been made, glue core screws with speaker cement.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Check the antenna trimmer alignment on a weak station at approximately 1200 Kc. Extend antenna to maximum before adjusting the antenna trimmer.

The approximate voltages are measured with a 1000 ohm per volt meter between the socket terminals and the chassis as shown on the circuit diagram. The Volume Control is set at maximum with no signal. Battery voltage is 6.3

AUTOMATIC TUNING

There are five automatic tuning positions which may be adjusted to five desired stations. If these positions have not been previously adjusted proceed as follows:

1. Press station selector bar until number 1 appears in station indicator window.
2. Pull manual tuning knob outward to engage the automatic mechanism.
3. Select the station desired and tune to its frequency by turning tuning knob. Tune very carefully for clearest reception.
4. Press station selector bar, pull manual tuning knob outward, and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5.

When the five automatic positions have been adjusted to the five desired stations as instructed, it is only necessary to press the station selector bar to return to dial tuning, or any one of the stations adjusted on the Automatic.

MANUAL TUNING

1. Press Automatic Tuning Station Selector (Fig. 2) several times or until the letter "M" appears in indicator window.
2. Pull Manual tuning control knob (right hand) outward and turn to tune in desired station. Be sure to tune to exact frequency to assure the best tone quality.

VOLUME—Adjust left hand control knob for desired volume.

TONE CONTROL—The tone control is located behind the volume control knob. Turn in either direction for most pleasing tone.

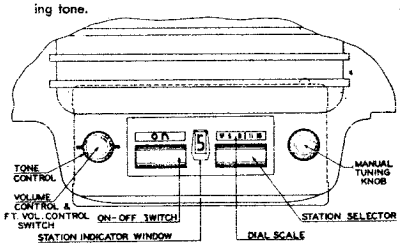

Fig. 2. Front View

©John F. Rider

INTERFERENCE SUPRESSION

There should be no motor noise or interference from the ignition circuit if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

The generator condenser No. 22-920 should be installed as shown below in Figure 3.

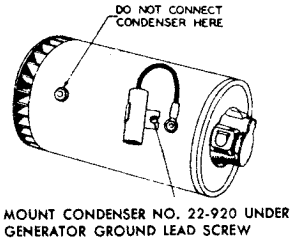

Fig. 3

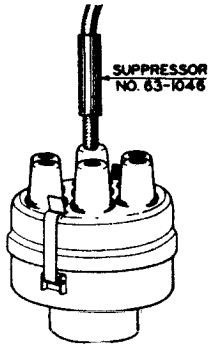

Fig. 4

The distributor supressor No. 63-1046 should be connected as shown above in Figure 4.

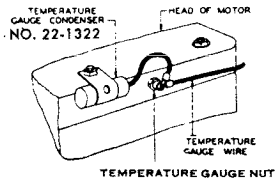

Fig. 5

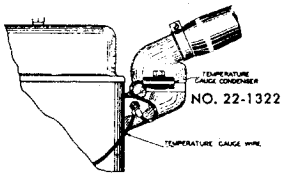

Fig. 6

The No. 22-1322 temperature gauge condenser should be installed as shown in Figure 5 for Nash 600 series cars and Figure 6 for Ambassador cars.

The ammeter and fuel gauge condensers No. 22-919 should be installed as shown in Figure 7.

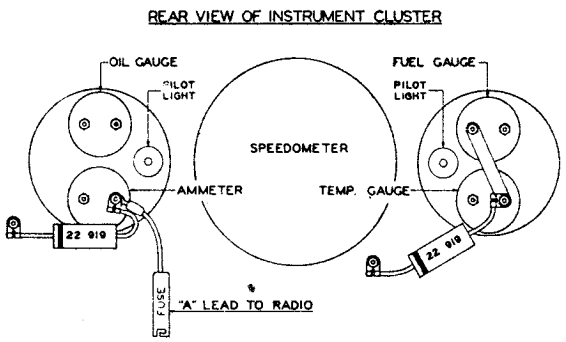

Fig. 7

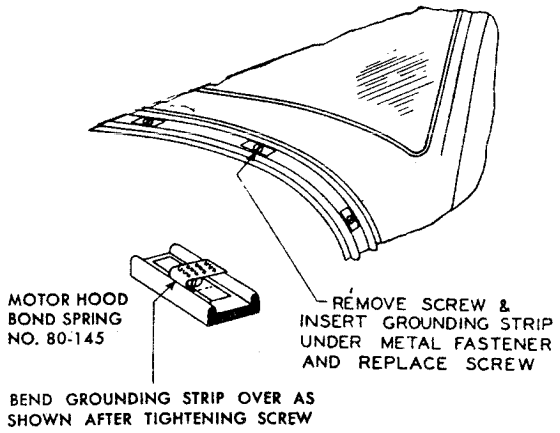
The motor hood bond spring No. 80-145 should be installed as shown in Figure 8. Note that the sharp extrusions are facing down toward the front of the car before the hood grounding strip is bent back. Make sure the instrument panel bolts and chassis mounting bolts are tight.



MOTOR HOOD BOND SPRING NO. 80-145
REMOVE SCREW & INSERT GROUNDING STRIP UNDER METAL FASTENER AND REPLACE SCREW
BEND GROUNDING STRIP OVER AS SHOWN AFTER TIGHTENING SCREW

Fig. 8

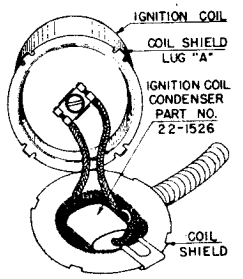


Fig. 9. Ign. Coil Cond.

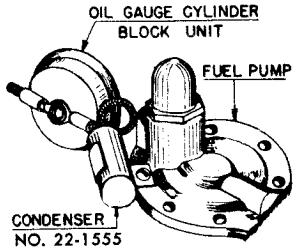

Fig. 9A. Oil Gauge Cond.

Straighten coil shield lugs "A" on back of ignition coil. Remove shield. Condenser should be installed as shown in Fig. 9. When replacing shield be sure to bend lugs down tightly to insure good connection between shield and coil. The oil gauge condenser should be installed as shown in Fig. 9A.

TO THE SERVICE MAN:

A feature of chassis 6C21 is a high gain tuned R.F. stage ahead of the conventional superheterodyne circuit.

When making repairs or adjustments on the chassis be sure to have the Phono-Radio switch in Radio position (button out).

The Tone Control circuit used in chassis 6C21 is unusual. Attenuation or control occurs in both the grid and plate circuit of the triode section of the 6SQ7 tube. To increase the bass response Resistor R10 and Capacitor C9 boost the bass in the grid circuit.

Capacitor C14 and the Variable Tone Control R12 attenuate the highs in the plate circuit.

When the tone control R12 is in the treble position attenuation to highs are greatly reduced in the plate circuit and minimum bass boost takes place in the grid circuit.

When the tone control is in bass position, attenuation to the highs takes place in the plate circuit with maximum bass boost in the grid circuit.

The result of this arrangement allows a smooth tone control over the audio frequency range.

MODEL NO. 6S071T

Chassis No. 5C61T

INSTRUCCIONES PARA LA INSTALACION, FUNCIONAMIENTO Y SERVICIO

GENERAL

Después de desembalar la combinación, quítese el papel engomado usado para la protección del chasis durante el embarque.

El receptor emplea un circuito superheterodino de sintonización altamente desarrollada sobre las siguientes bandas de onda larga y corta: 545 a 1520 kilociclos (550 a 197 metros), 2350 a 7100 kilociclos (127.7 a 42.3 metros) y 6900 a 22000 kilociclos (43.5 a 13.6 metros).

SUMINISTRO DE ENERGIA

Esta combinación está diseñada para funcionar ya sea en 50 ó 60 períodos de una corriente alterna (C.A.) de 105 a 120 voltios. El consumo total de corriente de las líneas de suministro es de 46 vatios.

PRECAUCION

No intente usar esta combinación con corriente contínua (C.C.) o con ninguna fuente de corriente fuera de la especificada previamente para evitar daño serio. Un transformador especial que puede obtener de su vendedor permitirá usarlo en 200 a 250 voltios de C.A.

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

After the combination has been unpacked, remove the paper tape used for protection of the chassis in shipment.

The receiver employs a highly developed superheterodyne circuit tuning over the following standard broadcast and shortwave bands: 545 to 1520 kilocycles (550 to 197 meters) 2350 to 7100 kilocycles (127.7 to 42.3 meters) and 6900 to 22000 kilocycles (43.5 to 13.6 meters).

POWER SUPPLY

This combination is designed for operation on either 50 or 60 cycle 105-120 volt alternating current (A.C.)

Total current consumption from the power lines is 46 watts.

CAUTION:

Do not attempt to use this combination on direct current D.C. or any current source other than that specified above otherwise serious damage will result. A special transformer obtainable from your dealer will permit use on 200 to 250 volt A.C. lines.

METHODE D'INSTALLATION, OPERATION ET SERVICE

GENERALITES

Après avoir déballé le poste-combinaison, les bandes de papier utilisées pour la protection du chassis durant le transport devront être enlevées.

Le poste emploie un circuit hautement développé superhétérodyne dont la bande de sélection couvre les rangées de radiodiffusion normales et les ondes courtes suivantes: de 545 à 1520 kilocycles (de 550 à 197 mètres), de 2350 à 7100 kilocycles (de 127,7 à 42,3 mètres) et 6900 à 22000 kilocycles (de 43,5 à 13,6 mètres).

SOURCE DE PUISSANCE

Cette combinaison fonctionne sur courant alternatif de 50 ou 60 cycles, 105-120 volts.

La consommation totale des lignes de puissance est de 46 watts.

PRECAUTION

N'essayez pas d'employer cette combinaison sur courant continu ou sur courant autre que celui mentionné plus haut, sinon de sérieux dégâts résulteront. Un transformateur spécial, à obtenir chez votre fournisseur, en permettra l'usage sur les lignes A.C. de 200 à 250 volts.

ANTENA

Es indispensable una buena antena para obtener la recepción satisfactoria. Una antena exterior de 13 a 20 metros de longitud y de la mayor altura posible dará buenos resultados para uso general. Si ha de usar su antena actual, ésta debe ser minuciosamente examinada para determinar su estado pues las conexiones pueden estar oxidadas o rotas haciéndola inapropiada para el uso. Si se ha de instalar una nueva antena hay que tomar las precauciones necesarias para que el alambre de bajada no haga contacto con las paredes, árboles o cualquier otro objeto en la conexión a tierra. Todas las conexiones deberán ser correctamente soldadas para evitar la oxidación y el ruido que se produciría. Conecte el alambre de bajada de la antena al alambre terminal marcado "Ant" en la parte posterior del chasis.

TIERRA

Una buena conexión a tierra mejorará efectivamente la recepción, aumentando la fuerza de las señales de las estaciones lejanas y reduciendo el ruido de fondo. La mejor conexión a tierra es un caño de un metro a 1.50 metros introducido en tierra húmeda.

El alambre a tierra debe ser soldado al caño o asegurado cuidadosamente con una buena grapa de tierra, previa limpieza cuidadosa del caño en ese punto. Una tierra conveniente

ANTENNA

A good antenna is necessary for satisfactory reception. An outside antenna from 40 to 60 feet in length and as high as possible will give good all-around results. If your present antenna is to be used, a thorough examination should be made to determine its condition. The connections may be corroded or broken, thus rendering the antenna unfit for service. If a new antenna is to be constructed, care should be taken to prevent the lead-in wire from grounding to trees, walls or gutters and all connections should be securely soldered to prevent corrosion and resulting noise. Connect the antenna lead-in to the wire marked "Ant" at the back of the chassis.

GROUND

A good ground will aid reception materially by improving the signal strength of distant stations and reducing background noise. The best ground is a 4 to 6 foot pipe driven in moist earth.

The ground wire should be soldered to the pipe or fastened securely with a good ground clamp, first thoroughly clean-

ANTENNE

Une bonne antenne est nécessaire pour obtenir une réception satisfaisante. Une antenne extérieure de 40 à 60 pieds (12-18 m) de long et aussi élevée que possible donne de bons résultats généraux. Si votre antenne actuelle devra être utilisée, elle devra subir un examen minutieux afin d'en déterminer l'état. Les couplages en peuvent être corrodés ou cassés, rendant par là l'antenne inutilisable. Si une nouvelle antenne est construite, prenez soin que la prise de terre n'aie pas lieu dans un arbre, sur un mur ou dans un fossé et tous les couplages devront être soudés avec soin afin d'éviter la corrosion et les bruits parasites Attachez le fil conducteur de l'antenne au fil marqué "Ant" au dos du chassis.

PRISE DE TERRE

Une bonne prise de terre aide considérablement à augmenter la puissance des stations distantes et diminuera les parasites. La meilleure prise de terre est un tuyeau de 4 à 6 pieds (1,25 à 2 mètres) enfoncé dans un sol humide.

Le fil de prise devra être soudé au tuyeau ou bien attaché fermement avec une bonne attache de prise, le tuyeau étant nettoyé soigneusement à cet endroit. Une prise de terre satisfaisante peut être obtenue en attachant solidement le fil de prise à un tuyeau

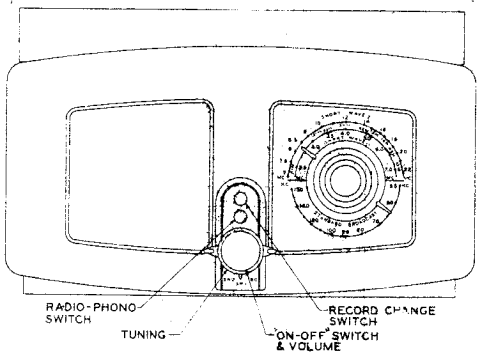

FIG. 1 PANEL CONTROLS

©John F. Rider

puede ser obtenida haciendo una buena conexión a un caño de agua o radiador. Conecte la bajada a tierra al alambre marcado "Gnd" en la parte posterior del chasis.

INTERRUPTOR FONOGRAFO-RADIO

El interruptor Fono-Radio es del tipo de botón de presión de doble acción.

Para tocar discos el botón debe ser introducido por presión. Presionando el botón una segunda vez lo volverá a la posición de Radio. (Vea la figura 1.)

SINTONIZACION

La figura 1 indica la posición de las perillas del control de sintonización y de volumen. Para poner el instrumento en funcionamiento, gire la perilla del control de volumen hacia la derecha. Esto pondrá en funcionamiento el aparato. Espere unos 30 segundos para que las válvulas alcancen la temperatura de funcionamiento.

Para sintonizar el aparato, gire la perilla de Control de Volumen lentamente a la estación deseada. Reajuste la perilla de Control de Volumen hacia la derecha o hacia la izquierda hasta alcanzar el volumen deseado. Para desconectar el receptor (OFF) gire la perilla de Control de Volumen todo lo que pueda hacia la izquierda, o hasta que oiga un ruido "clic."

El receptor tiene tres escalas de sintonización, cualquiera de los cuales puede ser seleccionada por medio del Interruptor de Banda (Vea la Fig. 1). La banda en uso estará indicada por el indicador del Interruptor de Banda.

Las estaciones de onda corta deberán ser sintonizadas girando la Perilla de Sintonización muy lentamente. El receptor es muy selectivo a las frecuencias más altas (ondas cortas).

La luz del día tiene una decidida influencia sobre la recepción de las estaciones de onda corta. Las diferentes longitudes de onda tienen mayor eficacia a diferentes horas del dia. Usese la tabla siguiente de guía para sintonizar.

ing the pipe at that point. A suitable ground may also be obtained by making a good connection to a water pipe or radiator. Connect the ground lead-in to the wire marked "Gnd" at the rear of chassis.

PHONO-RADIO SWITCH

The Phono-Radio switch is of the double acting push button type.

To play records the button must be pushed in. Pushing the button a second time will return it to the Radio position. (See Figure 1.)

TUNING

Figure 1 shows the position of Tuning and Volume Control knobs. To place the instrument in operation, turn the Volume Control knob to the right. This will turn on the set. Allow about 30 seconds for the tubes to reach operating temperature.

To tune the set, turn the Tuning Control knob slowly to the desired station. Readjust the Volume Control knob to the right or left for the desired volume. To turn the receiver OFF rotate the Volume Control knob as far as it will go to the left, or until a "click" is heard.

The receiver has three tuning ranges, any one of which may be selected by means of the Band Switch (see Fig. 1). The band in use will be indicated by the Band Switch pointer.

Short wave stations must be tuned in by turning the Tuning Knob very slowly. The receiver is very selective at the higher frequencies (short waves).

Daylight has a decided effect on the reception of short wave stations. Different wave lengths are most effective at different times of the day. Use the following table as a guide in tuning.

SHORT WAVE BAND	TIME OF BEST RECEPTION
16 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

d'eau ou à un radiateur. Branchez le fil de prise au fil marqué "Gnd" au dos du chassis.

COMMUTATEUR PHONO-RADIO.

Le commutateur Phono-Radio est du type bouton-poussoir à action double. Pour faire jouer les disques, appuyez sur le bouton. Appuyez une seconde fois et le poste sera remis à la position Radio. (Voyez la figure 1).

ACCORD

La figure 1 montre la position des boutons d'accord et de régulateur d'amplification. Pour mettre l'appareil en fonction, tournez le bouton du régulateur d'amplification vers la droite. Ceci mettra le poste en opération. Laissez les tubes se chauffer 30 secondes environ afin d'arriver à température de réception.

Pour obtenir la station voulue, tournez le bouton d'accord lentement jusqu'au point désiré. Ajustez à nouveau le bouton du régulateur d'amplification vers la droite ou la gauche jusqu'au volume convenable. Pour en cesser l'usage, tournez le bouton du régulateur d'amplification autant que possible, jusqu'à provoquer un déclic.

Ce poste a trois échelles d'accord; chacune d'entre elles peut être choisie par moyen du commutateur de bande (voir figure 1). La bande en usage est indiquée par l'aiguille du commutateur de bande.

La réception des stations à ondes courtes se fera en tournant le bouton d'accord très lentement. Le récepteur est très sélectif aux plus hautes fréquences (ondes courtes).

La lumière du jour a un effet décidé quant à la réception des stations à ondes courtes. Les longueurs d'ondes diverses auront leur meilleure réception à des heures diverses. Employez la table suivante comme guide pour la syntonisation.

TUBES

Les tubes suivants sont employés pour cette combinaison:

12SA7GT	50L6GT
12SK7GT	35Z5GT
7C6	7F7

VALVULAS

Las siguientes válvulas se emplean en esta combinación

12SA7GT	50L6GT
12SK7GT	35Z5GT
7C6	7F7

La figure 4 indica la posición correcta de cada válvula en su respectivo porta válvulas.

INSTRUCCIONES PARA EL FUNCIONAMIENTO DEL CAMBIA-DISCOS AUTOMATICO ZENITH CON BRAZO DE TONO COBRA

GENERALIDADES

Su Cambia-Discos Automático Zenith es un mecanismo nuevo muy mejorado equipado con el "pickup" revolucionario Cobra, una característica exclusiva de Zenith producida como resultado de muchos años de investigación y de desarrollo. Controles eléctricos ponen en funcionamiento su mecanismo de Comienzo-Detención con una velocidad relámpago (3½ segundos), por medio de un botón de presión situado en el tablero de control de recepción.

El sensacional Pickup Radiónico Cobra tiene un "Fila-

TUBES

The following tubes are employed in this combination:

12SA7GT	50L6GT
12SK7GT	35Z5GT
7C6	7F7

Figure 4 shows the correct position of each tube in its respective socket.

OPERATING INSTRUCTIONS FOR ZENITH AUTOMATIC RECORD CHANGER WITH COBRA TONE ARM

GENERAL

Your Zenith Automatic Record Changer is a new, highly improved mechanism equipped with the new revolutionary Cobra pickup, an exclusive Zenith feature, produced as the result of many years of research and development. Electric controls trip its Start-Stop mechanism with lightning speed (3½ seconds) by a push button on the receiver control panel.

La figure 4 montre la position propre à chaque tube dans son support respectif.

INSTRUCTIONS POUR L'EMPLOI DU CHANGE-DISQUES AUTOMATIQUE ZENITH AVEC BRAS-ACOUSTIQUE A SONORITE COBRA

GENERALITES

Votre Change-Disques Automatique Zénith est un nouvel appareil, beaucoup amélioré, muni du nouveau pick-up Cobra, un perfectionnement révolutionnaire produit exclusivement par Zenith après de nombreuses années de recherches et de développement. Des commandes électriques déclanchent son mécanisme d'appel Start-Stop avec la rapidité de l'éclair (3 secondes et demie) au moyen d'un bouton sur le panneau de contrôle du récepteur.

Ce pick-up radionique Cobra a le nouveau "Filament Flottant" qui allonge la durée d'usage d'un disque par mille pour cent et révèle une beauté de ton inconnue jusqu'ici et qui

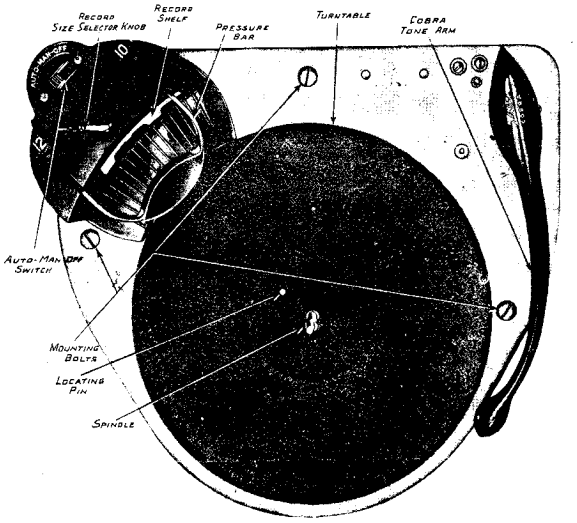

Fig. 2. Record Changer Top View

©John F. Rider

mento Flotante" nuevo que extiende la duración del disco más del 1000 por ciento, revela bellezas de tono no escuchadas hasta el presente y no es afectado por los cambios de temperatura y de humedad. El cambia-discos tocará automáticamente doce discos de 10 pulgadas ó diez discos de 12 pulgadas. Es posible un programa contínuo de su propia selección de 45 minutos de duración con una sola carga del cambia-discos.

El cambia-discos está equipado con un motor sincrónico de comienzo automático que impulsa la placa giratoria porta discos a 78 rpm. El cambia-discos puede hacerse funcionar con una corriente alterna (C.A.) de 50 ó 60 ciclos cambiando el manguito de la impulsión del motor.

PUESTA DEL CAMBIA-DISCOS EN FUNCIONAMIENTO

El Cambia-Discos ha sido embalado cuidadosamente para evitar ser dañado durante el embarque, debiéndose retirar todo el material de embalar antes de intentar ponerlo en funcionamiento. Asegúrese de leer todos los rótulos y remueva todas las cintas de embalar, pernos, etc.

Utilice un destornillador de hoja ancha y rote los pernos de montaje (Fig. 2) en el sentido de las agujas del reloj hasta que las cabezas estén parejas con la plancha de montaje. Esto permite que el cambiador "flote" montado contra sacudidas.

No deje de remover la banda de empaque para permitir que el pre-amplificador fono flote libremente montado sobre caucho; de lo contrario será oído el chillido del audio y microfónico cuando funcione el cambia discos.

PRECAUCION

El Cambia-Discos es expedido con el manguito del motor del fonógrafo instalado para 60 ciclos. El manguito de 50 ciclos está unido al Cambia-Discos debiendo ser instalado antes de intentarse hacerlo funcionar con una corriente de 50 ciclos.

The sensational Radionic Cobra Pickup has the new "Floating Filament" that lengthens record life over 1000 per cent, detects tone beauty unheard of before and is not affected by humidity and temperature changes. The changer will automatically play either twelve 10 inch records or ten 12 inch records. A continuous program of your own selection with a playing time of 45 minutes is possible with one loading of the changer.

The changer is equipped with a synchronous self-starting motor which drives the turntable at 78 RPM. The changer may be operated on 50 or 60 cycle alternating current (A.C.) by changing the motor drive bushing.

PLACING THE RECORD CHANGER IN OPERATION

The Record Changer has been securely packed to avoid damage in shipment and all packing material must be removed before an attempt to operate it is made. Be sure to read all tags and remove packing strips, bolts, etc.

Use a wide blade screwdriver and turn the three mounting bolts (see Fig ?) clockwise until the heads are flush with the mounting plate. This allows the changer to "float" on its shock mounts.

Do not fail to remove the packing strip to allow the phono preamplifier to float freely on its rubber mounts or audio howl and microphonics will be heard when playing the Record Changer.

CAUTION

The Changer is shipped with the 60 cycle phono motor bushing installed. The 50 cycle bushing is attached to the Changer and must be installed before operation on 50 cycle current is attempted.

n'est affectée ni par l'humidite, ni par les hausses et baisses de température. L Change-Disques jouera automatiquement soit douze disques de 25 cms., soit 10 disques de 30 cms. Un programme continu de votre propre choix d'une durée de jeu de 45 minutes est désormais possible avec une seule mise de disques.

Le Change-Disques est muni d'un moteur synchrone à déclanchement autonome qui donne au plateau tourne-disques une vitesse de 78 RPM. Le change-disques peut être utilisé sur un courant alterna-soit de 50, soit de 60 cycles en changeant la douille du moteur.

FONCTIONNEMENT DU CHANGE-DISQUES

Le Change-Disques a été empaqueté avec soin afin d'éviter d'être endommagé durant le transport et les papiers et autres matériaux d'emballage en seront enlevés avant d'essayer de faire fonctionner l'appareil. Lisez attentivement toutes les étiquettes et enlevez les bandes d'emballage, les boulons, etc.

Servez-vous d'un tournevis à large lame et tournez les trois boulons de montage (voyez figure 2) dans la même direction que les aiguilles d'une montre jusquà ce que les têtes des boulons soient à ras de la plaque de montage. Ceci permettra au Change-Disques de "flotter" sur son support anti-choc.

Ne pas omettre d'enlever les bandes d'emballage afin que le pré-amplificateur-phono puisse être balancé sans entraves sur sa monture de caoutchouc; sinon des audio-cris et des parasites microphoniques se feront entendre pendant la mise en jeu du Change-disques.

IMPORTANT

Le Change-Disques est expédié avec la douille phono-moteur de 60 cycles en place. La douille à 50 cycles est attachée au Change-Disques et doit être installée avant d'essayer de faire fonctionner l'appareil sur un courant de 50 cycles.

MANERA DE HACERLO FUNCIONAR

A. Cargamento para Funcionamiento Automatico

1. Colóquese la Perilla Selectora de Tamaño de Discos ya sea en 10 ó en 12, dependiendo del tamaño del disco que desee tocar. NO MEZCLE DISCOS DE 10 PULGADAS CON DISCOS DE 12 PULGADAS.

2. Elévese la Varilla de Presión lo más que sea posible.

3. Presiónese ligeramente y gírese el Vástago en sentido contrario al movimiento de las agujas de reloj hacia la posición de CARGA.

Posicion de Carga

4. Colóquese la pila de discos (hasta doce de 10 pulgadas ó diez de 12 pulgadas) sobre el vástago.

5. Colóquese la Varilla de Presión sobre la pila de discos.

B. Modo de Poner en Marcha el Cambia-Discos

1. Empújese el botón FONO-RADIO situado en el tablero de recepción.

2. Colóquese el interruptor AUTO-MAN-OFF en el Cambia-Discos en posición AUTO.

3. Empújese el botón del CAMBIA-DISCOS situado en el tablero de recepción. Si quisiera suprimir un disco, sólo es necesario empujar el botón del CAMBIA-DISCOS situado en el tablero de recepción. Esto permitirá que sea tocado el disco siguiente.

C. Detencion del Cambia-Discos

1. Cerciórese que la aguja esté en la posición de tocar (en contacto con el disco).

2. Colóquese el interruptor AUTO-MAN-OFF en posición OFF.

3. Elévese el brazo de tono y muévalo hacia la posición de descanzo (es decir, hacia la derecha de la placa giratoria).

HOW TO OPERATE

A. Loading for Automatic Operation

1. Set RECORD SIZE SELECTOR KNOB to either 10 or 12, depending on the size of record you wish to play. DO NOT INTERMIX 10 INCH AND 12 INCH RECORDS.

2. Raise the PRESSURE BAR up as far as it will go.

3. Press lightly and turn the SPINDLE counterclockwise to the LOAD position.

Load Position

4. Place the stack of records (up to twelve 10 inch or ten 12 inch) over the spindle.

5. Set the PRESSURE BAR down on the record stack.

B. Starting the Changer

1. Push PHONO-RADIO button on the receiver panel.

2. Set the AUTO - MAN - OFF switch on the Record Changer to AUTO.

3. Push the RECORD CHANGE button on the receiver panel. Should you desire to reject a record, it is only necessary to push the RECORD CHANGE button on the radio receiver panel. This will allow the next record to be played.

C. Turning the Changer Off

1. See that the needle cartridge is in the playing position (in contact with the record).

2. Set the AUTO - MAN - OFF switch to OFF.

3. Lift the tone arm and move it to the rest position (that is, to the right of the turntable).

COMMENT FAIRE FONCTIONNER L'APPAREIL

A. Mise de Disques Pour Fonctionnement Automatique

1. Placez le BOUTON SELECTEUR DE GRANDEUR DE DISQUES soit à 10, soit à 12 d'après la taille des disques que vous allez jouer. Ne mêlez pas de disques de grandeurs différentes.

2. Elevez la BARRE D'APPUI aussi haut que possible.

3. Appuyez légèrement et tournez le fuseau dans la direction opposée à celle des aiguilles d'une montre jusqu'à la position "LOAD" (MISE).

Position "Load"

4. Placez la pile de disques (jusqu'à 12 disques de 25 cms —ou 10 disques de 30 cms) sur le fuseau.

5. Remettez la BARRE D'APPUI sur la pile de disques.

B. Mise en Fonction du Change-Disques

1. Appuyez sur le bouton PHONO-RADIO au panneau du récepteur.

2. Placez le commutateur "AUTO - MAN - OFF" du Change-Disques à la position AUTO.

3. Appuyez sur le bouton CHANGE-DISQUES sur le panneau du récepteur. Quand vous voudrez rejeter un disque, vous n'aurez qu'à appuyer sur le bouton CHANGE-DISQUES au panneau du récepteur. Ceci mettra le disque suivant en jeu.

C. Arret du Change-Disques.

1. Il faut que l'aiguille soit en position pour le jeu (en contact avec le disque).

2. Placez le commutateur AUTO-MAN-OFF a la position OFF.

©John F. Rider

D. Descarga

Para retirar la pila de discos de la placa giratoria después que haya sido tocado el último disco, procédase de la siguiente manera:

1. Detóngase el Cambia-Discos de la manera descrita en el párrafo C.

2. Elévese la VARILLA DE PRESION lo más alto posible.

Posicion de Descarga

3. Presiónese ligeramente y gírese el VASTAGO en el sentido de las agujas de reloj hacia la posición de DESCARGA.

4. Levántese VERTICALMENTE toda la pila de discos o todos los discos que puede manipular convenientemente, hasta retirar los discos del vástago.

E. Funcionamiento Manual

Las grabaciones hechas en la casa no son para uso automático, debiendo ser tocadas manualmente; es decir, por separado, como se hace en un tocadiscos no automático. Para funcionamiento manual colóquese el interruptor AUTO-MAN-OFF en posición MAN (véase la Fig. 2). El brazo de tono queda libre, pudiendo ser movido a voluntad. Se suministra una aguja de ubicación sobre la placa giratoria para las grabaciones hechas en la casa.

F. Si se Deja el Cambia-Discos Funcianando

No se producirá daño alguno si olvida de detener el Cambia-Discos después que haya tocado toda la selección de discos. Repetirá el último disco hasta ser detenido o vuelto a cargar.

DISCOS RUIDOSOS

Si bien una tonalidad mala es ocasionada por una aguja gastada, el ruido de rayado y de fondo indica por lo general, un disco gastado. La cantidad de ruido de desgaste y de fondo en los discos nuevos variará de acuerdo con la calidad de fabricación, tipo de música grabada y el cuidado que se le presta a los discos. La colocación de una capa muy ligera de cera sobre el vástago eliminará el chillido causado por la fricción entre el vástago y los discos, toda vez que se presente este inconveniente.

D. Unloading

To remove the record stack from the turntable after the last record has been played, proceed as follows:

1. Turn the Record Changer OFF as described in paragraph C.

2. Raise the PRESSURE BAR as far up as it will go.

3. Press lightly and turn the SPINDLE clockwise to the UNLOAD position.

Unload Position

4. Raise the record stack, or as many records as you can conveniently handle STRAIGHT UP until the records are entirely clear of the spindle.

E. Manual Operation

Home recordings are not intended for automatic use and must be played manually, that is, singly as on a non-automatic record player. For manual operation set the AUTO-MAN-OFF switch to the MAN position (see Fig. 2). The tone arm is now free and may be moved at will. A locating pin is provided on the turntable for home recordings.

F. If the Changer Is Left Running

No damage will be done if you forget to turn off the Changer after it has played the entire selection of records. It will repeat the last record until stopped or reloaded.

NOISY RECORDS

Poor tone is usually caused by a worn needle cartridge, however, scratch and background noise usually indicates a worn record. The amount of wear and background noise on new records will vary depending on the quality of manufacture, type of music recorded and care given the records. A very thin coat of wax on the spindle will eliminate squeaking caused by friction between the spindle and records (should this condition exist).

CUIDADO DE LOS DISCOS

Un pequeño esfuerzo hecho por usted les asegurará una larga duración a sus discos. No los exponga al calor solar, de los radiadores o de las estufas. Guarde sus discos en álbumes en un sitio fresco y seco, en posición vertical u horizontal. Retírese el polvo y la suciedad con un paño suave, empleando un movimiento circular. Mismo una fina película de polvo contiene frecuentemente partículas abrasivas, que cuando se muelen contra la superficie del disco por la aguja pueden ocasionar desgaste muy rápido.

Importante

Nunca deje permanecer a los discos sobre el vástago cuando no está en uso el Cambia-Discos pues podría ocasionar la combadura y la falla del Cambia-Discos para tocar tales discos.

CAMBIO DEL CARTUCHO DE AGUJAS

En caso de que se haga necesario cambiar el Cartucho de Agujas debido a desgaste o cuidado inapropiado, estúdiese la Fig. 3 y procédase de la manera siguiente:

3. Levez le bras acoustique et mettez-le à la position de repos, c'est-à-dire à la droite du plateau tourne-disques.

D. Pour Enlever

Pour enlever la pile de disques du plateau après avoir joué le dernier disque, faites ce qui suit:

1. Tournez le commutateur à la position OFF, comme on l'a décrit plus haut au paragraphe C.

2. Levez la BARRE D'APPUI aussi haut que possible.

3. Appuyez légèrement et tournez le fuseau dans la même direction que les aiguilles d'une montre jusqu'à la position UNLOAD.

Position "Unload"

4. Levez la pile de disques, ou autant d'entre eux que vous voulez soulever facilement, tout droit jusqu'à ce que les disques soient entièrement dégagés du fuseau.

E. Fonctionnement Manuel.

Les disques faits chez soi ne sont pas prévus pour le jeu automatique et doivent être employés manuellement, c'est-à-dire, séparément, comme sur un gramophone ordinaire, non-automatique. Pour ce fonctionnment manuel, tournez le commutateur AUTO-MAN-OFF à la position MAN (voyez la figure 2).

Le bras acoustique est maintenant libre et vous pouvez le mouvoir à votre gré. Une aiguille de repère est placée sur le plateau tourne-disques pour les disques faits chez soi.

F. Cas Dans Lesquels le Change-Disques est Oublie en Action

Aucun dégât ne résultera si vous oubliez d'interrompre le Change-Disques après avoir joué tous vos disques. Il répétera le dernier jusqu'à ce que vous l'arrêtiez ou le remplaciez.

DISQUES BRUYANTS

Une sonorité défectueuse est causée d'habitude par une aiguille usagée. Un bruit de râclage ou des ronflements parasites indiquent d'ordinaire que le disque a été endommagé par l'usage. Une rapide usure de disques neufs et la présence de bruits parasites dépendra de la qualité de la manufacture, du type de musique enregistrée et du soin que l'on aura pris du disque. Une couche de cire très mince sur le fuseau éliminera le grincement causé par le frottement du disque contre le fuseau si cette condition existe.

CARE OF RECORDS

Small effort on your part will insure long life for your records. Do not expose them to heat from the sun, radiators or stoves. Store your records in albums in a cool, dry place resting vertically or horizontally. Remove dust and dirt with a soft cloth using a light circular motion. Even a fine film of dust often contains abrasive particles which, when ground against the record surface by the needle can cause very rapid wear.

Important

Never allow records to remain on the spindle when the Record Changer is not in use. To do so may result in warping and failure of the Changer to play such records.

CHANGING THE NEEDLE CARTRIDGE

If it becomes necessary to change the Needle Cartridge due to wear or mishandling, study Fig. 3 and proceed as follows.

SOIN DE DISQUES

Très peu d'effort de votre part vous assurera d'une longue durée pour vos disques. Ne les exposez pas à la chaleur du soleil, des radiateurs ou des fourneaux. Gardez vos disques dans des albums en un endroit frais et sec et placez-les, soit horizontalement, soit verticalement. Epoussetez-les avec un chiffon fin et un léger mouvement circulaire. Une couche de poussière, quelque légère qu'elle soit, contient souvent des particles abrasives, qui, lorsqu'elles sont écrasées sur la surface du disque par l'action de l'aiguille, l'endommageront rapidement.

Important

Ne laissez jamais les disques sur le fuseau lorsque vous n'employez pas le Change-Disques. Cela pourrait faire gauchir et fausser les disques et démonter le Change-Disques.

CHANGEMENT DE LA CARTOUCHE A AIGUILLE

S'il est nécessaire de changer la cartouche à aiguilles, soit qu'elle soit usée ou qu'elle ait été endommagée, étudiez la figure 3 et faites ce qui suit:

Needle Cartridge Out — Inserting Needle Cartridge

Fig. 3. Replacing the Needle Cartridge

1. Colóquese el interruptor OFF-MAN-AUTO en posición OFF.

2. Elévese el BRAZO DE TONO.

3. Tómese el CARTUCHO DE AGUJAS rojo con la punta de los dedos y retíresela suavemente hacia fuera en línea recta.

4. Insértese un nuevo CARTUCHO DE AGUJAS y empújela hacia adentro suavemente con el pulgar. El Cartucho es graduado, pudiendo sólo ser insertado en un sentido. Póngase cuidado, pues forzando el cartucho en un ángulo inapropiado dañará la ranura.

1. Set the OFF - MAN - AUTO switch to OFF.

2. Raise the TONE ARM.

3. Grasp the red NEEDLE CARTRIDGE with the finger tips and gently pull it straight out.

4. Insert a new Needle Cartridge and push it in gently with the thumb. The Cartridge is indexed and can only be inserted one way. Use care — forcing the cartridge in at the wrong angle will damage the socket.

1. Tournez le commutateur AUTO-MAN-OFF à position OFF.

2. Levez le bras acoustique.

3. Saisissez la cartouche à aiguilles rouge entre le bout des doigts et tirez doucement tout droit.

4. Insérez une nouvelle cartouche et enfoncez-la lentement avec le pouce.

La cartouche est marquée et ne peut être mise en place que d'une seule façon. Faites-le avec soin. Si vous enfoncez la cartouche de biais avec force le porte-aiguille sera endommagé.

INSTRUCCIONES PARA LA INSTALACION Y FUNCIONAMIENTO

INFORMACION GENERAL

Este receptor es un moderno aparato superheterodino de 7 válvulas, con una gama de ondas comprendiendo frecuencias entre 545 y 21,900 Kilociclos. Esta gama de ondas está dividida en tres bandas, marcadas en el cuadrante como sigue: "Broadcast" — "Short Wave 1" — "Short Wave 2." La mayor facilidad de sintonización en la onda corta en las cinco escalas adicionales, incorporando las bandas de 13, 16, 19, 25 y 31 metros, se obtiene por medio de ampliación de banda, la cual permite que las estaciones de onda corta se sintonicen con la misma facilidad que las estaciones locales.

¡OJO! Asegúrese que los pernos que soportan el chasís durante el embarque estén suficientemente flojos para premitir que el chasís flote libremente antes de que el receptor se ponga a funcionar.

SUMINISTRO DE ENERGIA

Este radio receptor puede ajustarse para ser operado con una fuente de energía de 115 voltios, 40 a 60 períodos, o con 235 voltios, 40 a 60 periodos, así como con un acumulador de 6 voltios, por medio del conmutador que se encuentra en la parte posterior del chasis.

Cuando se utiliza un acumulador como fuente de energía conéctese el alambre ROJO del receptor al polo positivo (+) del acumulador, y el alambre NEGRO del receptor al polo negativo (—).

Si el receptor produce un zumbido constante cuando está conectado con corriente alterna, inviértase el tomacorriente en el zócalo de la pared.

¡OJO! BAJO NINGUNA CIRCUNSTANCIA HA DE CONECTARSE ESTE RECEPTOR A CORRIENTE CONTINUA (C.C.) POR CAUSAR ESTO DAÑOS IRREPARABLES.

INSTALLATION, OPERATING AND SERVICE INSTRUCTIONS

GENERAL

This receiver is a modern 7-tube superheterodyne with tuning ranges covering frequencies between 545 k.c. and 21,900 k.c. This tuning range is divided into three bands which are labeled on the dial scale "Broadcast" — "Short Wave 1" and "Short Wave 2." Extreme ease of tuning over the short wave band is provided by means of five additional tuning ranges covering the 13, 16, 19, 25 and 31 meter bands with a band spread arrangement which allows short wave stations to be tuned in as easily as stations on the broadcast band.

CAUTION: Make sure that the bolts supporting the chassis during shipment are loosened sufficiently to allow the chassis to float freely before the receiver is placed in operation.

POWER SUPPLY

This receiver may be adjusted for use on either a 115 volt, 40 to 60 cycle power supply, 235 volt 40 to 60 cycle power supply, or a 6-volt storage battery by means of the switch on the rear of the chassis.

When a storage battery is used as the source of power, care should be taken that the RED battery lead of the receiver is connected to the positive (+) terminal of the battery, and the BLACK lead to the negative (—) terminal of the battery.

If the receiver has a constant hum when connected to an alternating current power supply reverse the power plug in the wall socket.

CAUTION: UNDER NO CIRCUMSTANCES SHOULD THE POWER CORD BE CONNECTED TO DIRECT CURRENT AS SEVERE DAMAGE WILL RESULT.

TUBES

The following tubes are used (See Fig. 2)

7H7	7C6
6K8GT	6L5G
7B7	1J6G
	6X5G

INSTRUCTIONS POUR INSTALLATION ET FONCTIONNEMENT

GENERALITES

Poste de T.S.F. superhétérodyne de 7 lampes avec rangées couvrant les périodes entre 545 et 21,900 k.c. L'échelle de sélection est divisée en trois rangées marquées sur le vernier "Broadcast" — "Ondes courtes 1" et "Ondes courtes 2." La sélection des stations en ondes courtes se fait aussi facilement que celle sur ondes longues, grâce à 5 échelles différentes pourvues d'une extension, couvrant les rangées de 13, 16, 19, 25 et 31 mètres.

PRECAUTION: Assurez-vous que les boulons qui supportent le châssis en route soient suffisamment lâches pour permettre qu'il flotte librement avant que le poste soit mis en fonction.

SOURCE D'ALIMENTATION

Ce poste récepteur peut être ajusté pour être utilisé sur une source d'alimentation de 115 volts, de 40 à 60 périodes, ou sur une de 235 volts de 40 à 60 périodes ou encore sur un accu de 6 volts, au moyen du commutateur qui se trouve au dos du chassis.

Quand on utilise un accumulateur comme source d'alimentation, on doit faire attention que le fil rouge au dos du récepteur soit branché à la borne positive (+) de l'accumulateur, et le fil noir, à la borne négative (—).

Si un grondement se produit dans le récepteur après qu'il ait été branché à une source d'alimentation de courant alternatif, changez la position de la fiche dans le réceptacle monté dans la cloison.

PRECAUTION: CE RECEPTEUR DE T.S.F. NE DOIT SOUS AUCUN PRETEXTE ETRE BRANCHE A UNE SOURCE DE COURANT CONTINU (C.C.) POUR EVITER DES DOMMAGES SERIEUX.

LAMPES

Il emploie les lampes suivantes (Voir Fig. 2):

7H7	7C6
6K8GT	6L5G
7B7	1J6G
	6X5G

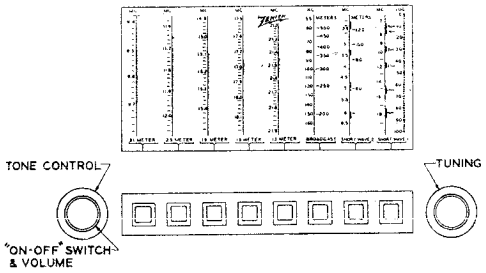

FIG. 1. Controls

VALVULAS

Las siguientes válvulas son usadas (Véase Fig. 2)

7H7	7C6
6K8GT	6L5G
7B7	1J6G
	6X5G

Cuando se usa una antena "doublet," el alambre doble tiene que conectarse a las terminales A y Z en la parte de atrás del chasis, y el anillo que conecta las terminales Z y G tiene que ser removido.

Cuando se usa una antena de un solo alambre, éste se conecta a la terminal A, y el anillo que conecta las terminales Z y G se deja donde está, y una buena conexión tierra tiene que hacerse a la terminal G. La antena tiene que ser de 15 a 30

When using a doublet antenna the twisted pair should be connected to terminals A and Z on the rear of the chassis, and the connecting link between terminals Z and G should be removed.

When using a single wire antenna, the lead-in is connected to terminal A, the connecting link between terminals Z and G is left in place and a good ground connection should be connected to terminal G. The antenna should be from 50 to 100 feet in length, and placed as high as possible. Too long an antenna may cause interference between stations, while too

Quand on emploie une antenne "Doublet" les fils doivent être branchés aux bornes A et Z au dos du châssis, et le contacteur entre les bornes Z et G doit être enlevé.

Quand l'antenne que l'on utilise a un seul fil, il doit être branché à la borne A, le contacteur entre Z et G laissé en place et une bonne prise de terre faite à la borne G. L'antenne doit avoir de 50 à 100 pieds de long et installée aussi haut que possible. Une antenne trop longue peut causer des interférences entre les stations, tandis qu'une trop courte donnera une réception

©John F. Rider

metros de largo y tiene que colocarse tan alto fuera del edificio como sea posible. Una antena demasiado larga puede causar interferencia entre estaciones, mientras que una antena demasiado pequeña dará como resultado una recepción defectuosa de las estaciones más débiles. Nunca debe conectarse el receptor a una antena vieja sin antes haberla examinado cuidadosamente para determinar su condición, porque las conexiones pueden estar rotas u oxidadas, reduciendo así el rendimiento del receptor.

FUNCIONAMIENTO

La posición y el nombre de cada perilla de control está señalado en la Fig. 1. El uso de estas perillas es como sigue:

Interruptor de Fuerza y Regulador de Volumen — Gírese la perilla a la derecha. Se requieren aproximadamente 30 segundos para que las válvulas se calienten y el receptor esté en condiciones para funcionar. Siguiendo la rotación de esta perilla se aumenta el volumen.

Conmutador de Ondas — Los ocho botones debajo del cuadrante determinan la banda que ha de usarse. Solamente apriete el botón correspondiente a la banda que se desea sintonizar. La escala del cuadrante que se encuentra directamente encima del botón que se usa, automáticamente entra en función.

Sintonización—La perilla situada a la derecha se utiliza para sintonizar las diferentes escalas del cuadrante. La sintonización ha de hacerse lenta y cuidadosamente para evitar que las estaciones más lejanas y débiles pasen desapercibidas; un arreglo de volante interior se usa para pasar fácil y rapidamente dé un extremo al otro. Solamente hágase girar la perilla en la dirección deseada, y el volante continuará la rotación hasta el sitio deseado en la escala, donde el indicador se detiene por medio de una ligera presión en la perilla.

small an antenna will result in poor reception from the weaker stations. Never connect an old antenna to your receiver without a thorough examination first being made to determine its condition, as the connecions may be broken or corroded and cause very unsatisfactory reception.

OPERATION

The position and purpose of the control knobs are shown in Fig. 1. The use of each is as follows:

Volume and On-Off Switch — Rotation to the right turns the receiver on. Approximately 30 seconds is required for the tubes to heat before reception will be obtained. Continued rotation of this control regulates the volume.

Band Switches. — The 8 push buttons at the bottom of the escutcheon determine which tuning range is in use. Merely press the button corresponding to the wave band over which tuning is desired. The dial scale immediately above the button which has been pressed will then be in use.

Tuning — The right hand knob is used to tune over the various dial scales. All tuning should be very slowly and carefully done so as not to pass over the weaker more distant stations. The internal fly wheel arrangement is used to provide an easy means of moving rapidly from one portion of the scale to another. Merely spin the knob in the direction required, the fly wheel will keep it in rotation until the desired portion of the scale is reached after which a slight pressure on the knob will stop further rotation.

When tuning for a station move the pointer over the signal in both directions and set it at the point of maximum volume, least noise and clearest tone. Daylight has a decided effect on the reception of short wave stations and different wave lengths are most effective at different times of the day. The following table may be used as a

piètre dans les stations faibles. Il ne faut jamais brancher le récepteur à une vielle antenne sans en faire l'examen complet de sa condition, car les connections peuvent être cassées ou corrodées et donner par là un mauvais rendement.

FONCTIONNEMENT

La position et le but des boutouns de commande sont montrés sur la Fig. 1. et leur utilisation est comme suit:

Commutateur Marche-Arrêt et de Volume — Le récepteur est branché quand le bouton est tourné vers la droite. Trente secondes suffisent approximativement pour que les lampes puissent être chauffées avant que l'on obtienne une réception. On contrôle le volume en tournant le bouton davantage vers la droite.

Commutateur d'échelles — Les 8 bouton-poussoirs au bas de l'écusson indiquent l'échelle utilisée. Pressez simplement sur un bouton pour obtenir l'échelle que l'on désire. Immédiatement le vernier qui se trouve au-dessus du bouton sera mis en utilisation.

Sélection — Le bouton à droite sert à faire la sélection des diverses échelles sur le vernier. La sélection doit être faite doucement et soigneusement pour ne pas passer les stations faibles et lointaines. Une combinaison de roues à engrenages procure le moyen de faire le déplacement d'un bout à l'autre du vernier rapidement. Faites simplement tourner le bouton dans la direction voulue et le système de roues à engrenages continuera à tourner jusqu'à ce que l'on atteigne la partie du vernier que l'on désire, après quoi une légère pression sur le bouton arrêtera la rotation de ce dernier.

Quand on fait la sélection d'une station, placez l'aiguille-repère des deux cotés de la démarcation jusqu'à ce que l'on obtienne le volume maximum, le moindre bruit, et la tonalité la plus claire. La réception sur

Cuando se esté sintonizando una estación, muévase la aguja sobre la señal en ambas direcciones hasta encontrar el punto de mayor intensidad, menor ruido y mayor claridad de tono. La luz del día tiene una decidida influencia sobre la recepción de la onda corta, y diferentes longitudes de onda alcanzan mayor eficacia a diferentes horas del día. El cuadro a la derecha puede ser usado como guia para sintonizar a diferentes horas del día y la noche.

REGULADOR DE TONO

El regulador de tono proporciona un medio para variar la proporción de tonos altos y bajos y permite que el tono del receptor se cambie a gusto del radio-escucha.

Rotación a la izquierda aumenta la proporción de notas bajas y rotación a la derecha aumenta las notas altas.

FONOGRAFO

Este receptor puede ser usado como un excelente amplificador de fonógrafo conectando cualquier tocadiscos con un brazo acústico de alta impedancia a las terminales de fonógrafo en la parte posterior de chasis y poniendo el conmutador de fono-radio en la posición "phono." Los reguladores de volumen y tono del receptor se usan para regular la reproducción de discos.

guide for listening at different times during the day or night.

SHORT WAVE BAND	TIME OF BEST RECEPTION
15 meters and below	A.M. (Morning hours)
19 and 25 meters	P.M. (Afternoon)
25 and 31 meters	P.M. (Early evening)
31 and 49 meters	P.M. (Late evening)

TONE CONTROL

The tone control provides a means of varying the proportion of bass and treble notes and allows the tone of the receiver to be changed to suit the user's taste.

Rotation to the left increases the proportion of bass or low notes and rotation to the right increases the treble notes.

PHONO

The receiver may be used as an excellent phono amplifier by connecting any good high impedance type phono pickup to the phono terminals on the rear of the chassis and placing the phono-radio switch on the rear of the chassis in the "phono" position. The volume and tone controls of the receiver will be effective on record reproduction.

ondes courtes est affectée définitivement par le jour, de même que celle sur différentes longueurs d'ondes est plus ou moins efficace à divers moments de la journée. Le graphique à gauche peut être utilisé comme guide d'écoute pour la réception à différents moments pendant le jour ou la nuit.

COMMANDE DE TONALITE

La commande de tonalité procure un moyen de combiner les notes basses avec les aigües et permet aussi de changer la tonalité du récepteur à son goût

La rotation du bouton vers la gauche augmente les notes basses et vers la droite les notes aigües.

PHONO

Le récepteur peut être utilisé comme un excellent amplificateur de phono en branchant le pickup de bonne impédance aux bornes du phono au dos du châssis et en plaçant le commutateur radio-phono qui se trouve aussi au dos du châssis dans la position "phono." Les commandes de volume et de tonalité sont très efficaces dans la reproduction phonographique.

SCHEMATIC DIAGRAM FOR 7 TUBE
LINCOLN 7ML080 — CONTINENTAL 7ML081
WITH FOOT SELECTOR CONTROL
I. F. 265KC
TUNING RANGE 540 KC. TO 1600 K.C.

TUNING RANGE: ..... 540-1600 Kc.
INTERMEDIATE FREQUENCY: ..... 265 Kc.
CURRENT CONSUMPTION: ..... 8.5 amperes
INSTANTANEOUS CURRENT CONSUMPTION DURING AUTOMATIC CHANGE CYCLE: ..... 20 amperes

SENSITIVITY: ..... 6 microvolts at one watt output.
UNDISTORTED POWER OUTPUT: .....
7.5 watts measured at the voice coil.
SPEAKER: ..... 6" x 9" oval, instrument panel mounting.

©John F. Rider

DELAYED AUTOMATIC MUTING CIRCUIT

Pressing the touch-bar or the foot control switch automatically mutes the receiver during the station changing cycle. After the hand or foot pressure is removed, the noise of tuning through stations on the return stroke is eliminated automatically. This special circuit applies a large negative voltage to the 1st audio grid to bias it beyond cut off. When the tuner is operated, the delayed muting switch S3 on the back of the tuner connects the grid side of the condenser C19 to ground and charges it positively. As soon as the tuner starts its return stroke, the switch grounds the positive terminal of the condenser and ungrounds the grid side. The grid side now becomes negative with respect to ground and cuts off the 1st audio tube. The charge rapidly leaks off through R12 and R14, and the receiver operates normally after the change cycle.

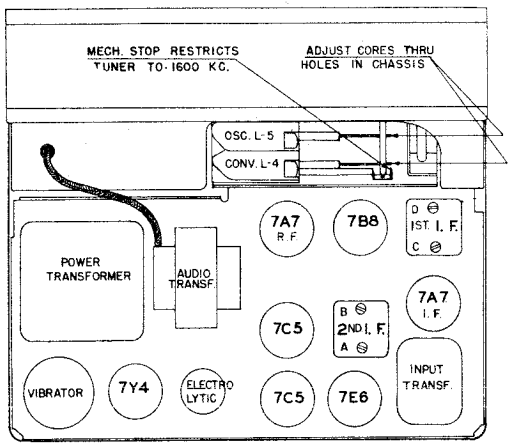

Fig. 9. Top View of Chassis

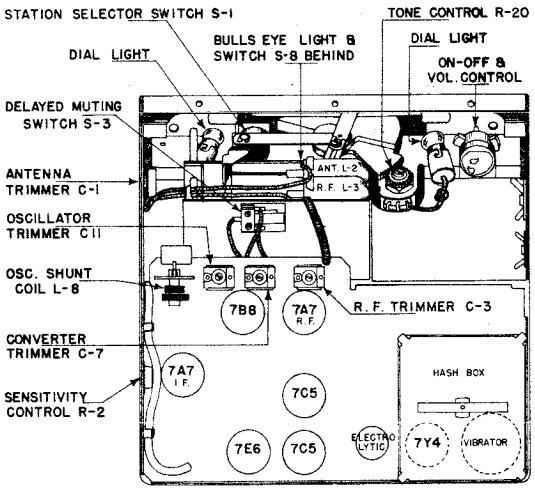

Fig. 10. Bottom View of Chassis

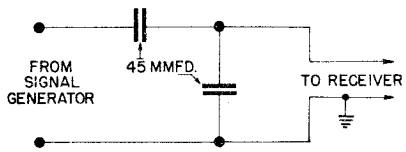

Fig. 11

Figure 11 shows the schematic of a recommended dummy antenna, closely resembling actual antenna capacity, to be used in series with signal generator leads when aligning the R.F. section of the receiver.

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; therefore follow these instructions carefully.

CAUTION: Make all alignment adjustments to the receiver with the volume control set at maximum and the tone control in the treble position. Reduce the signal intensity as much as possible at the signal generator. Connect the output meter across the voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 465 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C and D (Fig. 9) in the order named for maximum output. Repeat the operation to assure accurate alignment.

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy illustrated in Fig. 11 to antenna lead in socket on receiver.
2. Set signal generator to 535 Kc.
3. Place set in manual tuning position and set dial to 535 Kc.
4. Adjust oscillator trimmer C-11 (Fig. 10) for maximum response.
5. Set signal generator to 1200 Kc.
6. Tune set to 1200 Kc.
7. Adjust converter trimmer C-7 (Fig. 10) and R.F. trimmer C-3 (Fig. 10) for maximum response.
8. If dial calibration is off after making above adjustments, a correction can be made by turning eccentric screw at fulcrum of dial pointer.

CORE OR COIL REPLACEMENT ONLY

WARNING: The following adjustments are to be made ONLY if a core or coil is replaced.

1. Replace coil or core.
2. Set signal generator to 1700 Kc.
3. Connect signal generator leads through dummy illustrated in Figure 11 to antenna receptacle on the receiver.
4. Set receiver dial to 1600 Kc. (Maximum high frequency end of dial.)
5. Screw the core complete out of the antenna coil, the R.F. coil, the converter coil, and the oscillator coil.
6. Adjust oscillator trimmer C-11 Fig. 10 at 1700 Kc.
7. Adjust converter trimmer C-7, R.F. trimmer C-3, and antenna trimmer C-1 (Fig. 10) for maximum output reading.
8. Replace cores to their approximate original positions.
9. Set generator dial and receiver dial to 1200 Kc.
10. Adjust oscillator core L5 (Figure 9) to scale at 1200 Kc.
11. Adjust antenna, R.F. and converter cores (Figures 9 and 10) for maximum output reading.
12. Set signal generator to 600 Kc.
13. "Rock in" shunt oscillator coil L8 (Fig. 10) for maximum output reading. This should be done only as a last resort. This is the same as rocking in the padder condenser on a ganged condenser receiver.
14. Check receiver at 1200 Kc. for calibration and gain. If the receiver is off scale or weak, repeat operations 9, 10 and 11.
15. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc., the mechanical stop for the tuner cross arm should be bent to limit the frequency coverage to 1605 Kc.

After all adjustments have been made, glue core screws with speaker cement.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Extend antenna to maximum. Check the antenna trimmer alignment on a weak station at approximately 1200 Kc.

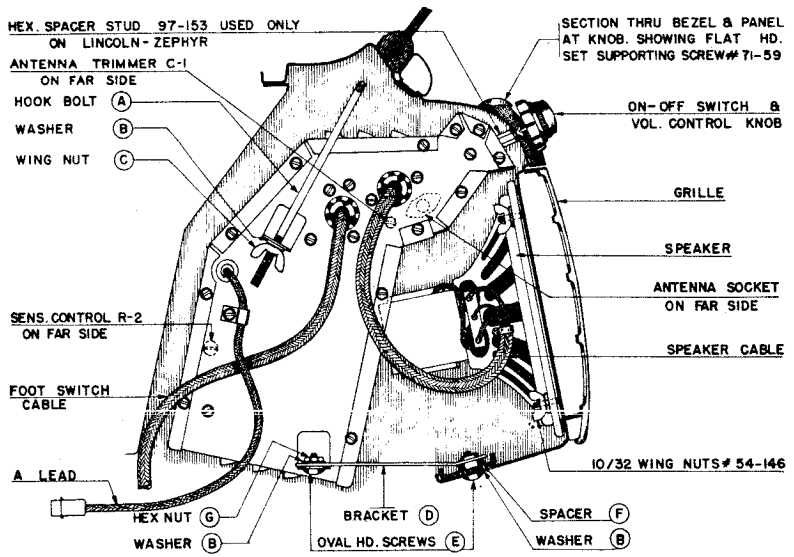

Fig. 2. Lincoln

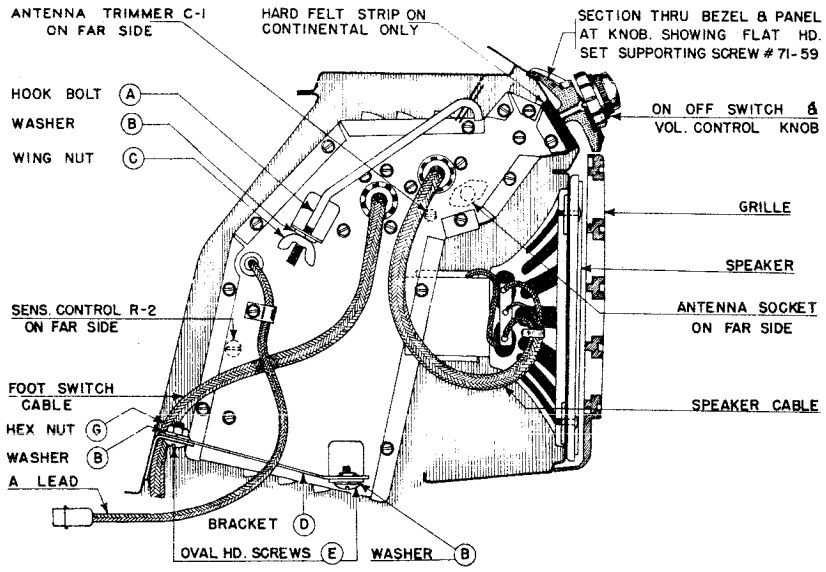

Fig. 2A. Continental

RECEIVER INSTALLATIONS

Figures 1, 1A, 2 and 2A, illustrating the escutcheon plates, control knobs and the installed receivers, are given here to facilitate removal and reinstallation of the receivers when service or repair is necessary.

To take the receiver from the car, remove the tuning and volume control knobs. Remove the 8-32 flathead screws that support the receiver at the top. Remove the lower support brackets "D" and finally loosen the hook bolts "A."

To remove the Continental speaker, remove grille (held in place by four nuts on back side of instrument panel). Then remove four machine screws No. 69-84 holding the speaker to the front of the instrument panel. (Fig. 2A.)

The Lincoln speaker is held to the rear of the panel by four wing nuts No. 54-146. (Fig. 2.)

MANUAL TUNING

1. Press station selector touch-bar (Fig. 1) several times or until the green dot appears in the back ground of the dial.

2. Pull manual tuning (right hand) control knob outward and turn to tune in desired station. Be sure to tune to exact frequency to assure the best tone quality.

VOLUME—Adjust left hand control knob for desired volume.

TONE CONTROL—The tone control is located under dial cale. (Fig. 1.) Turn in either direction for most pleasing one.

ADJUST-O-MATIC TUNING

If not previously set up for Adjust-O-Matic operation, proceed as follows:

1. Press station selector touch bar (Fig. 1) until green dot appears in dial scale background. Press the touch bar once more to advance Adjust-O-Matic mechanism to the No. 1 position.

2. Pull manual tuning knob outward to engage the Adjust-O-Matic mechanism.

3. Select the station desired and tune to its frequency by turning the tuning knob. Tune very carefully for clearest reception.

4. Press station selector bar, pull tuning knob outward and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5.

When the five Adjust-O-Matic positions have been adjusted to the five desired stations as instructed, it is only necessary to press the selector bar to return to dial tuning or to any one of the stations selected on the Adjust-O-Matic.

INTERFERENCE SUPPRESSION

There should be no motor noise or interference from the ignition circuit if the receiver has been installed in the car according to the instructions furnished with it. The interference suppression equipment may be checked for proper installation by referring to the following illustrations:

The two ignition coil condensers No. 22-1147 should be installed as shown in Figure 3 below.

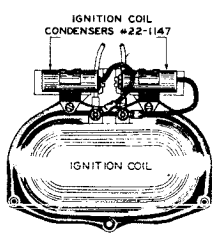

Fig. 3

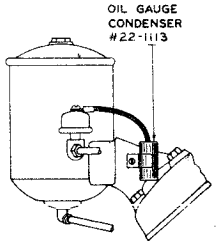

Fig. 4

The oil gauge condenser No. 22-1113 should be installed as shown in Figure 4.

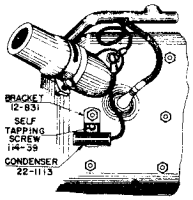

Fig. 5

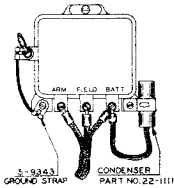

Fig. 6

The temperature gauge condenser No. 22-1113 should be installed with its bracket fastened under one of the cylinder head nuts as shown in Figure 5.

The voltage regulator condenser and ground strap should be installed as shown in Figure 6.

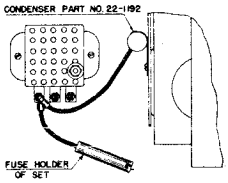

Fig. 7

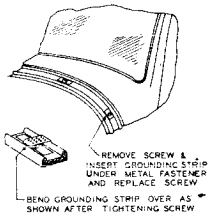

REMOVE SCREW & INSERT GROUNDING STRIP UNDER METAL FASTENER AND REPLACE SCREW
BEND GROUNDING STRIP OVER AS SHOWN AFTER TIGHTENING SCREW

Fig. 8

The No. 22-1192 condenser and the "A" lead should be connected together at the circuit breaker inside the car above the steering column as shown in Figure 7.

The No. 80-145 motor hood bond spring should be installed as illustrated in Figure 8.

MOTOR NOISE SUPPRESSION KIT

S12125	Motor noise suppression kit complete
S-9343	Ground strap
12-831	Suppressor condenser mtg. bracket
22-1111	Voltage regulator condenser
22-1113	Water gauge & oil gauge condenser
22-1147	Ignition coil condenser
22-1192	"A" lead condenser
80-145	Motor hood bond spring
114-39	No. 8 x ¼ hex head S.T. screw

INSTALLATION PARTS

S12126	Set installation kit complete
12-972	Set installation bracket
19-114	Foot switch cable clip
54-99	No. 12-24 x 7/16 hex nut
54-146	No. 10-32 wing nut (4 used)
54-151	No. 12-24 wing nut (2 used)
64-141	Foot switch installation eyelet
68-4	No. 6 Allen head set screw wrench
71-59	No. 8-32 x ½ flat head M.S.
93-340	3/32 x .255 x ½ washer (steel)
93-372	No. 12 int. shakeproof lockwasher
93-524	Foot switch installation washer
112-310	No. 10 x 2 R.H. S.M. screw
112-342	No. 12-24 x 5/8 B.H. M.S.
112-348	Set installation screw

PARTS LIST CONTINENTAL MODEL 7ML081 (CHASSIS 7C80)

1946 ADJUST-O-MATIC RADIO

The parts list for Model 7ML081 is the same as for Model 7ML080 with the following parts omitted and added:

ADD

Diagram No.	Part No.	Description
SP2	49-539	6" x 9" dynamic speaker
	112-545	Set installition screw L.H.
	112-546	Set installation screw R.H.
	69-84	10/32 x ¼ R.H. M.S.
	71-29	8/32 x 7/8 F.H M.S.
	93-369	No. 10 internal shakeproof lock-washer
	93-593	7/16 external shakeproof lock-washer
	208-539*	Cone and voice coil

OMIT

Diagram No.	Part No.	Description
SP1	49-543	6" x 9" dynamic speaker
	97-235	Set installation mounting stud
	54-146	10/32 wing nut (4 used)
	71-59	8/32 x ½ flat head M.S.
	112-348	Set installation screw
	208-543	Cone and voice coil

When ordering cone and voice coil assembly marked*, be sure to give manufacturer's code letter that follows base number.

CHASSIS 8C40, 8C40BT

TO THE SERVICE MAN:

CAUTION—Before attempting to operate this receiver, make certain that the Line Voltage Switch is properly set.

1. For 110-125 V. AC or DC operation set the Line Voltage Switch to 115 V. AC-DC.

2. For 210-240 V. AC operation, set the switch to the 220 V. AC position.

3. For 210-240 V. DC operation, set the switch to the 220 V. DC position.

The 8C40BT chassis is an AC, DC or battery operated superheterodyne circuit with a stage of tuned radio frequency amplification and band spread tuning over the 49, 31, 25, 19, and 16 meter bands.

The audio amplifier used in chassis 8C40BT features phase inversion and push-pull power output.

If removal of the chassis from the cabinet becomes necessary, great care must be exercised so that the coil assembly is not damaged.

The 8C40BT chassis is isolated from the DC circuits, and all measurements must be from a common negative point. The most convenient place to reach this point is at the junction where C13 is connected to the filter condenser. The DC resistance from the chassis to any circuit must be almost infinite. If any circuit becomes grounded to the chassis, a hum will appear. Microphonic tubes will cause an audio howl. Check the 1LD5 and 1LC6 tubes.

The wavemagnet is connected to the chassis through the hinges in the cabinet, snaps and flexible leads. If the RF becomes weak or dead, check resistance of wavemagnet at the condenser gang. The DC resistance across the two leads should be approximately 1 ohm. If the circuit is open, unscrew the four wood screws and the two screws which hold the handle. The top can now be removed and connecting leads will be visible for inspection. Also loosen the snap-on socket and check for broken or shorted leads.

The alignment of chassis 8C40BT is conventional. However, care must be exercised when making adjustments, and the alignment procedure must be followed exactly. Set the chassis over a metal plate approximately the same distance the battery pack is from the bottom of the chassis when it is in the cabinet. This procedure will introduce the approximate amount of metal in the field of the RF and oscillator coils as when the chassis is in the cabinet. A signal generator of reasonable accuracy and good attenuation must be used. An output meter (AC) of the copper oxide rectified type with a range of 1 to 30 volts in several steps is necessary to get accurate output readings. Alignment wrenches should be of the non-metallic type, especially when making adjustments at the higher frequencies.

When reinstalling the chassis in the cabinet be careful not to disturb the cabling between the short wave coil assembly and chassis. Tune in a weak broadcast signal near 1400 Kc., and touch up trimmer C9. This will insure maximum performance after alignment.

A LOS MECANICOS

PRECAUCION: Antes de empezar el funcionamiento de este receptor, cerciórese de que el interruptor del Voltaje de la Linea esté debidamente ajustado.

1. Para corriente de 110-125 voltios, corriente continua o corriente alterna, adjústese el interruptor del Voltaje de la Linea a 115 voltios C.C. o C.A.

2. Para corriente de 210-240 v. C.A., ajústese el interruptor a 220 v. C.A.

3. Para corriente de 210-240 v. C.C., ajústese el interruptor en la posición de 220 v. C.C.

El bastidor 8C40BT es un circuito superheterodino que funciona por corriente alterna o corriente continua o por batería de acumuladores con una etapa de amplificación de radiofrecuencia sintonizada y un ensanche de banda que sintoniza con las bandas de 49, 31, 25, y 16 metros.

La válvula amplificadora de audofrecuencia que se usa en el bastidor 8C40BT da importancia a la inversión de fases y a la salida simétrica de la energía.

Si se hace necesario quitar el bastidor del armario, deberá ejercerse gran cuidado para evitar que se dañe el embobinado.

El bastidor 8C40BT está aislado de los circuitos de corriente continua, y todas las medidas deben hacerse desde un punto negativo común. El lugar más conveniente para alcanzar este punto está en la unión donde C13 está conectado al condensador del filtro. La resistencia de la corriente continua procedente del bastidor a cualquier circuito deberá ser casi infinita. Si uno de los circuitos está a masa (cortocircuito) con el bastidor, se oirá un zumbido. Las válvulas microfónicas producirán un aullido de audio. Examínense las válvulas 1LD5 y 1LC6.

El imán de ondas está conectado al badtidor por medio de las bisagras en el armario, garras, y conductores (plomos) flexibles. Si la energía radiofrecuente se debilita o no existe. inspecciónese la resistencia del imán de ondas en el múltiple del condensador. La resistencia de la C.C. a través de los dos conductores (plomos) deberá sera aproximadamente de 1 ohm. Si el circuito está abierto, afíjense los cuatro tornillos de madera y los dos tornillos que sostienen el mango. Ahora, la tapa se puede quitar, quedando visibles para su inspección los conductores conectadores. Afíjese también el casquillo de resorte y exáminese para ver si hay conductores rotos o en cortocircuito.

El alieamiento del armazón 8C40BT es convencional; sinembargo, debe tenerse cuidado al hacerse ajustes o composturas, y es imperativo hacer el alineamiento siguiendo el procedimiento exactamente. Colóquese el armazón sobre una plancha de metal aproximadamente a la misma distancia que el paquete de los acumuladores está del armazón cuando éste está en el armario. Este procedimiento introduciró en el campo de las bobinas de R.F. y del oscilador la cantidad aproximada de metal que hay cuando el armazón está en el armario. Hay que usar un generador de señales que funcione con exactitud y buena atenuación. Se necesita un medidor de rendimiento de C.A. del tipo rectificado de óxido de cobre, con una amplitud de 1 a 30 voltios en varias etapas, para obtener medidas correctas del rendimiento. Hay que usar llaves de alineamiento que no sean de metal, especialmente cuando se hagan ajustes o reparaciones en las frecuencias altas.

Cuando se instale otra vez el armazón en el armario, téngase cuidado de no desarreglar las posicion de los cables que se extienden entre el conjunto de la bobina de onda corta y el armazón. Sintonícese con una señal de radiodifusión débil cerca de 1400 Kc., y tóquese la pieza C9 (trimmer). Así se obtendrá en funcionamiento máximo después del alineamiento.

MODULATION HUM: Under humid conditions, the insulating material inside the a-c plug, and the back cover would absorb moisture and if the solder lug was in contact with this material, some of the a-c voltage would leak into the back cover. Since this back cover was next to the loop, hum modulation would be evident.
To remedy this condition, remove the back from the receiver, and open the a-c connector, and bend the solder lug away from the insulating wall. A vinylite sleeve over the solder lugs will insure good insulation.

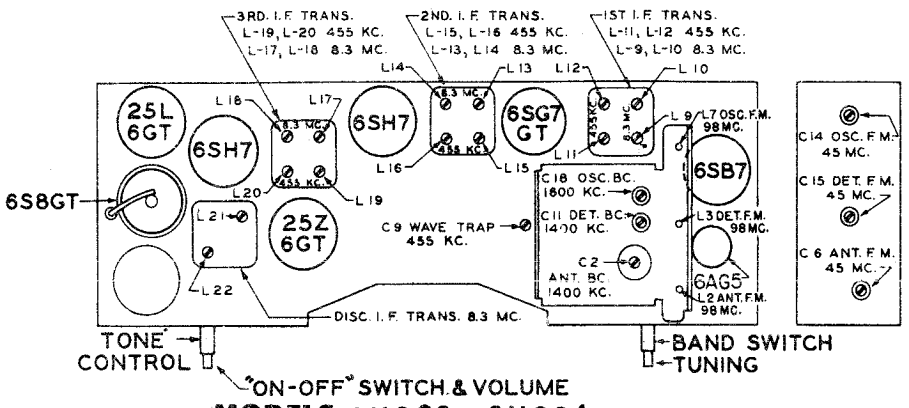
HUM COMES UP AS VOLUME CONTROL IS ADVANCED: Hum in the 8C01 chassis may be caused by an open .05-200v condenser which is connected between the metal shell of the volume control and chassis.

TO THE SERVICE MAN:

The 8C01 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

When adjustments are made on the 8C01 or any AC-DC chassis, a line isolation transformer (110 V input to 110 V output) is recommended in order to avoid a "hot" chassis. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, and if there is any indication of voltage, reverse the plug before handling the set.

AM Alignment: The alignment of this chassis on the standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool(fiber screw driver) or the threads in the coil forms will strip and adjustment will be impossible.



MODELS 8H023 – 8H034
CHASSIS No. 8C01
TUBE AND TRIMMER LOCATION

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustments the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM I.F.'s. Observe the same precautions when making adjustments. The second 8.3 Mc If stage is overcoupled. Overcoupling gives a wide band pass with good sensitivity. When an overcoupled stage is aligned with an unmodulated signal, the stage must be loaded. A 300 ohm carbon resistor soldered across the secondary of the second IF transformer provides a satisfactory load for this circuit. The resistor leads must be kept short to reduce the distributed capacity of the circuit.

When aligning a loaded stage, it will be found that considerable signal from the generator will be required, and that it will tune broadly. THE LOAD RESISTOR MUST BE REMOVED AFTER ALIGNMENT.

If the signal generator used does not have sufficient output to overcome the temporary loss caused by the load resistor, the load resistance may be increased or the signal fed into the preceding stage.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 6) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when this meter starts to go to the left (negative) of zero will give the same results.

ALIGNMENT PROCEDURE

Operation	Connect Oscillator to	Dummy Antenna	Input Signal Frequency	Band	Set Dial To	Adj. Trimmers	Purpose
1	Pin 8 on Converter Tube 6SB7 Socket	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	L-11,12,15,16, 19 and 20	Align I.F. channel for maximum output
2	Pin 1 on R.F. tube 6AG5 socket	.05 Mfd.	455 Kc. Modulated	BC	600 Kc.	C9	Adjust wavetrap for minimum output
3	2 turns loosely cpld. to wavemagnet		1600 Kc. Modulated	BC	1600 Kc.	C18	Set oscillator to dial scale
4	2 turns loosely cpld. to wavemagnet	.05 Mfd.	1400 Kc. Modulated	BC	1400 Kc.	C11 & C2	Align det. and ant. stages.
5 (a)	Pin 4(grid)on 6SH7 limiter socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L21 coil slug Primary discr.	Align primary of discrimator for maximum reading
6 (b)	Pin 4(grid)on 6SH7 limiter socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L22 coil slug sec. of disc.	Adjust secondary of discriminator for zero reading
7 (c)	Pin 4 (grid) on 6SH7 2nd IF tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L17 & L18 Prim.&Sec.of 3rd IF trans.	Align 3rd IF transformer for maximum reading
8(c)(d	Pin 4 (grid) on 6SG7 1st IF tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L13 & L14 primary and sec. of 2nd IF transformer	Align 2nd IF transformer for maximum reading
9(c)(d	Pin 8(grid) on 6SB7 converter tube socket	.05 Mfd.	8.3 Mc. Unmodulated	FM 45		L9 & L10 Primary & Sec. of 1st IF transformer	Align 1st IF transformer for maximum reading
10 (c)	Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L7 Osc. Coil slug	Set oscillator to dial scale
11 (c)	Antenna Post (Remove line ant.)	270 ohms	98 Mc. Unmodulated	FM 100	98 Mc.	L3 & L2 Det. and RF coil slugs	Align det. and ant. stages to maximum reading
12 (c)	Antenna Post (Remove line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45Mc.	C14	Set oscillator to dial scale
13 (c)	Antenna Post (Remove line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C15 & C6	Align detector & ant. stages for maximum reading

IMPORTANT: Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead should be shielded.

An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter pin 5 on discriminator transformer to chassis (half discriminator load.)
(b) Vacuum Tube Voltmeter pin 7 on discriminator transformer to chassis (full discriminator load.)
(c) Vacuum Tube Voltmeter 6SH7 limiter grid (pin 4) to chassis.
(d) 300 ohm $\frac{1}{2}$ watt carbon resistor soldered across the secondary L14 (pin 2 and 3 of 2nd, IF trans.). The leads to the resistor must be as short as possible and the resistor removed before operation 10 is started.

CHASSIS 8C20-8C21-8HO-9HO-SERIES

HUM COMPLAINT ON 9HO SERIES:

Check audio and a-c leads to the volume control. The leads from the tone control must be dressed away from the a-c leads. The high voltage secondary leads from the power transformer must be dressed away and close to the chassis from the 47,000 resistor on the tap points.

HOWL ON AM 8HO SERIES:

Howl due to vibrations transmitted into the oscillator sections of the gang condenser by the speaker. To remedy this condition, a felt strip can be placed between the rear of the gang, and the first i-f transformer. It may also be necessary to move the oscillator section lead underneath the gang slightly to reduce tension.

STRIPPED IF SLUG INSERTS:

Damaged i-f slug thread inserts may be replaced by unscrewing the slug and pushing out the old insert.
Two types of inserts are used, 83-1063 short and 83-1069 long.

FM SPEAKERS 8HO AND 9HO SERIES:

Some of the earlier 8C20-21 chassis are wired for electro-dynamic speakers only. Later production sets are wired for either electro-dynamic or PM speakers which have the filter unit attached to the speaker frame. These chassis are identified by a dot of black paint on or near the speaker socket. To use the PM speakers on the earlier sets, it will be necessary to run a lead from B-(center tap of high-voltage winding) to a lug on the speaker socket which connects to the negative side of the filter on the speaker.

BUZZ IN DIAL ESCUTHEON 8HO AND 9HO SERIES:

If the dial assembly comes in contact with the power transformer a buzz will result and a 83-1331 felt spacer should be added between the dial and transformer.

INCREASING BASS RESPONSE OF PHONO:

To increase the bass response on records, the value of R5 in the phono preamplifier may be increased. Do not increase the value to over 10,000 ohms or audio howl may be heard.

IMPROVING FM RECEPTION ON 8HO AND 9HO SERIES:

In FM Consoles, a cabinet FM antenna may be added in addition to the line antenna. This antenna is made up of two 28 inch lengths of wire. One wire is connected to the FM antenna post, the other to chassis. The two wires are then tacked in the cabinet in opposite directions, and should not come in contact with ground.

WAVE TRAP TRIMMER SHORTING OUT:

A .002 mfd 600 volt condenser has been added in series with the wave trap. This condenser removes the d-c potential from the trap and eliminates the possibility of breakdown.

AUDIO HOWL AS VOLUME CONTROL IS ADVANCED (FM RECEPTION):
FM howl may be caused by the speaker vibrating the oscillator slug. A fiber spacer between the oscillator, and detector slug shafts in the FM tuner will eliminate vibration. A thin rubber band tied to the center of the oscillator slug shaft and upper frame will also eliminate the howl.

TO THE SERVICE MAN:

The 11C21 chassis incorporates a superheterodyne circuit with two stages of IF, and one stage of RF amplification on all bands.

AM Alignment: The alignment of this chassis on the short wave and standard broadcast band is conventional. The alignment slugs in the IF transformers are threaded and screw into the coil forms. The slugs are slotted for a small size fiber screw driver. Do not press hard on the aligning tool (fiber screw driver) or the threads in the coil forms will strip and adjustment will be impossible.

FM RF Alignment: The same coil slug arrangement which tunes the 100 MC FM band also tunes the 45 MC band. However, on 45 MC the band switch connects trimmer condensers in parallel and padding wires in series with the 100 MC coils. The tuning slugs are attached to threaded shafts and the slugs are varied in the field of the coils by turning the shafts clockwise or counter-clockwise. After adjustments the shafts must be secured with a drop of speaker cement.

FM IF Alignment: The same type of tuning slugs for aligning the AM IF Amplifier are used for the FM I.F.'s. Observe the same precautions when making adjustments. The second 8.3 Mc IF stage is overcoupled. Overcoupling gives a wide band pass with good sensitivity. When an overcoupled stage is aligned with an unmodulated signal, the stage must be loaded. A 300 ohm carbon resistor soldered across the secondary of the second IF transformer provides a satisfactory load for this circuit. The resistor leads must be kept short to reduce the distributed capacity of the circuit.

When aligning a loaded stage, it will be found that considerable signal from the generator will be required, and that it will tune broadly. THE LOAD RESISTOR MUST BE REMOVED AFTER ALIGNMENT.

If the signal generator used does not have sufficient output to overcome the temporary loss caused by the load resistor, the load resistance may be increased or the signal fed into the preceding stage.

FM Discriminator Alignment: When the secondary of the discriminator is aligned (operation 9) use sufficient signal input to get a good positive and negative indication before setting the slug for zero reading. A center zero indicating meter is recommended for this adjustment, but is not absolutely necessary. Reversing the leads of a non-zero center meter, or observing closely when this meter starts to go to the left (negative) of zero will give the same results.

HUM COMPLAINT: Check for excessive length of the a-c line cord inside the main chassis between the point of entrance and the solder lugs. This slack may be in close proximity of the tone control leads.

DIFFERENCES IN 11C21-11C21Z CHASSIS: Sets using chassis 11C21Z are equipped with FM speakers. FM speakers cannot be used on 11C21 chassis. When ordering speaker replacements specify 11C21 or 11C21Z chassis.

IMPROVING FM RECEPTION: In FM Consoles a cabinet FM antenna may be added in addition to the line antenna. This antenna is made up of two 28-inch lengths of wire. One wire is connected to the FM antenna post, the other to chassis. The two wires are then tacked in the cabinet in opposite directions, and should not come in contact with ground.

HOWL ON FM: FM howl may be caused by the speaker vibrating the oscillator slug. A fiber spacer between the oscillator, and detector slug shafts in the FM tuner will eliminate vibration. A thin rubber band tied to the center of the oscillator slug shaft and upper frame will also eliminate the howl.

INCREASING BASS RESPONSE ON PHONO: To increase the bass response on records, the value of R5 in the phono-preamplifier may be increased. Do not increase the value to over 10,000 ohms or audio howl may be heard.

STRIPPED IF THREAD INSERTS: Damaged IF slug thread inserts may be replaced by unscrewing the slug, and pushing out the old insert. Two types of inserts are used, 83-1063 short, and 83-1069 long.

WAVE TRAP TRIMMER SHORTS OUT: A .002 mfd 600 volt condenser has been added in series with the grounded side of the wave trap.

16 (c)	Antenna Post (remove line ant.)	270 ohms	45 Mc. Unmodulated	FM 45	45 Mc.	C14 and C6	Align detector and ant. stages for maximum reading

IMPORTANT: Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustments have been tampered with.

Correct alignment can only be made if the following procedure is followed:

A vacuum tube voltmeter with an isolation resistor of 200,000 ohms in series with the hot lead will serve for FM adjustments. This lead must be shielded.

An ordinary AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments.

The signal generator output should be kept just high enough to get an indication on the meter.

(a) Vacuum Tube Voltmeter pin 5 on discriminator transformer to chassis (half discriminator load.)

(b) Vacuum Tube Voltmeter pin 7 on discriminator transformer to chassis (full discriminator load).

(c) Vacuum Tube Voltmeter 6SH7 limiter grid (pin 4 to chassis).

(d) 300 ohm ½ watt carbon resistor soldered across the secondary L18 (pin 2 and 3 of 2nd IF trans.). The leads to the resistor must be as short as possible and the resistor removed before operation 13 is started.

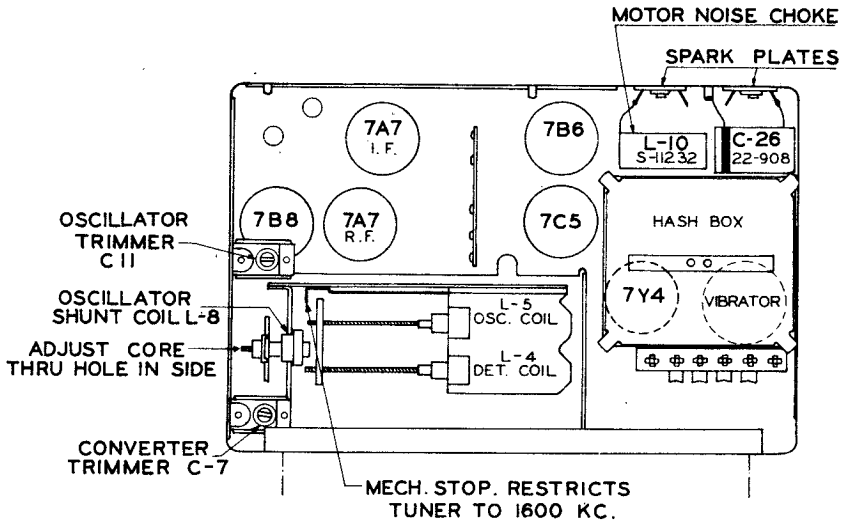

Fig. 11. Bottom View of Chassis

ALIGNMENT

Maximum performance depends on accurate alignment of the receiver; so follow these instructions carefully.

CAUTION: Make all adjustments on the receiver with volume control turned full on and foot volume control cable plugged into its socket. Reduce signal intensity as much as possible at signal generator. Connect output meter across voice coil.

I.F. ALIGNMENT PROCEDURE

1. Remove top and bottom covers from receiver.
2. Set signal generator to 265 Kc.
3. Apply signal from generator through a .1 Mfd. dummy to 7B8 converter grid. (Pin No. 6 on socket.)
4. Adjust I.F. trimmers A, B, C and D (Fig. 10), in the order named for maximum output. Repeat the operation to assure accurate alignment.

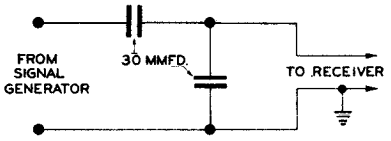

Figure 12. Dummy Antenna

Figure 12 shows the schematic of a recommended dummy antenna closely resembling actual antenna capacity to be used when aligning the R.F. section of the receiver.

R.F. AND OSCILLATOR ALIGNMENT

1. Connect signal generator leads through dummy illustrated in figure 12 to antenna lead in socket on receiver.
2. Set signal generator to 535 Kc.
3. Place set in manual tuning position and set dial to 535 Kc.
4. Adjust oscillator trimmer C-11 (Fig. 11) for maximum response.
5. Set signal generator to 1200 Kc.
6. Tune set to 1200 Kc.
7. Adjust converter trimmer C-7 (Fig. 11) and R.F. trimmer C-3 (Fig. 10) for maximum response.
8. If dial calibration is off after making above adjustments, a correction can be made by loosening dial scale mounting screws and sliding scale to desired position.

CORE OR COIL REPLACEMENT ONLY

WARNING: The following adjustments are to be made ONLY if a core or coil is replaced.

1. Replace coil or core.
2. Set signal generator to 1700 Kc.
3. Connect signal generator leads through dummy illustrated in figure 12 to antenna receptacle on the receiver.
4. Set receiver dial to 1600 KC. (Maximum high frequency end of dial.)
5. Screw the core completely out of the antenna coil, the R.F. Coil, the converter coil, and the oscillator coil.
6. Adjust oscillator trimmer C-11 (Fig. 11) at 1700 Kc.
7. Adjust converter trimmer C-7, R.F. trimmer C-3, and antenna trimmer C-1 (Fig. 10 and 11) for maximum output reading.
8. Replace cores to their approximate original positions.
9. Set generator dial and receiver dial to 1200 Kc.
10. Adjust oscillator core (Fig. 10) to scale at 1200 Kc.
11. Adjust the antenna core, R.F. core, and converter core (Fig. 10 and 11), for maximum output reading.
12. Set signal generator to 600 Kc.
13. "Rock in" Shunt oscillator coil (Fig. 10) for maximum output reading. (This should only be done as a last resort.) This is the same as rocking in the padder condenser on a ganged condenser receiver.
14. Check receiver at 1200 Kc. for calibration and gain. If receiver is off scale or weak, repeat operations 9, 10 and 11.
15. After alignment is complete, the maximum high frequency tuning range should be checked. If the range is greater or less than 1605 Kc. the mechanical stop for the tuner cross arm should be bent to limit the frequency coverage to 1605 Kc.

After all adjustments have been made, glue core screws with speaker cement.

IMPORTANT: After reinstalling the receiver in the car, allow it to operate for approximately 15 minutes to reach normal operating temperature. Check the antenna trimmer alignment on a weak station at approximately 1200 Kc. Extend antenna to maximum before adjusting the antenna trimmer.

©John F. Rider

MANUAL TUNING

1. Press the automatic tuning push button on the left side beneath automatic indicator window several times or until the letter "M" appears on the automatic indicutor.
2. Pull manual tuning (right hand) control knob outward and turn to tune in desired stations. Tune to exact frequency for the best tone quality.

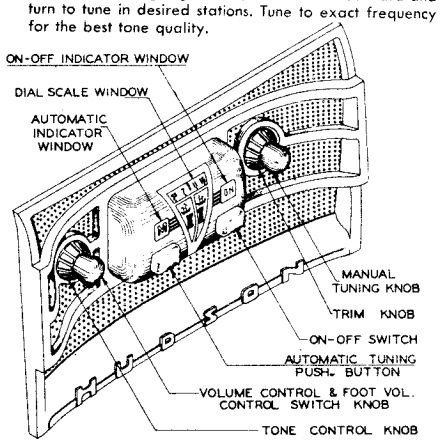

Fig. 1. Operating Controls.

AUTOMATIC TUNING

There are five automatic tuning positions which may be adjusted to five desired stations. If these positions have not been previously adjusted, proceed as follows:

1. Press the automatic tuning push button (on the left side) until Number 1 appears in the automatic indicator window.
2. Pull the manual tuning knob OUTWARD to engage the automatic mechanism.
3. Select the station desired and tune to its frequency by turning the tuning knob. Tune very carefully for clearest reception. CAUTION: DO NOT ATTEMPT TO FORCE TUNING KNOB IN. Knob will return to the "IN" position when the automatic tuning push-button is pressed.
4. Press the automatic station selector push button, pull manual tuning knob outward, and tune in station desired for No. 2 position. Use same procedure for positions No. 3, 4 and 5.

When the five automatic positions have been adjusted to the five desired stations as instructed, it is only necessary to press the AUTOMATIC button to return to MANUAL tuning, or to any one of the stations selected on the automatic.

FOOT CONTROL

The Foot Control provides a convenient means of selecting stations, controlling the volume, and muting the set without taking the hands off the steering wheel or the eyes from the road. Its function is identical to that of the station selector push button and the volume control knob combined. The foot control requires no set up or other adjustment. Press the foot control button all the way down to change stations. Press lightly to silence radio during conversation. Turn the knob with the shoe tip to adjust the volume to any desired point. When using the foot volume control feature turn the panel volume control fully to the left, or until it clicks.

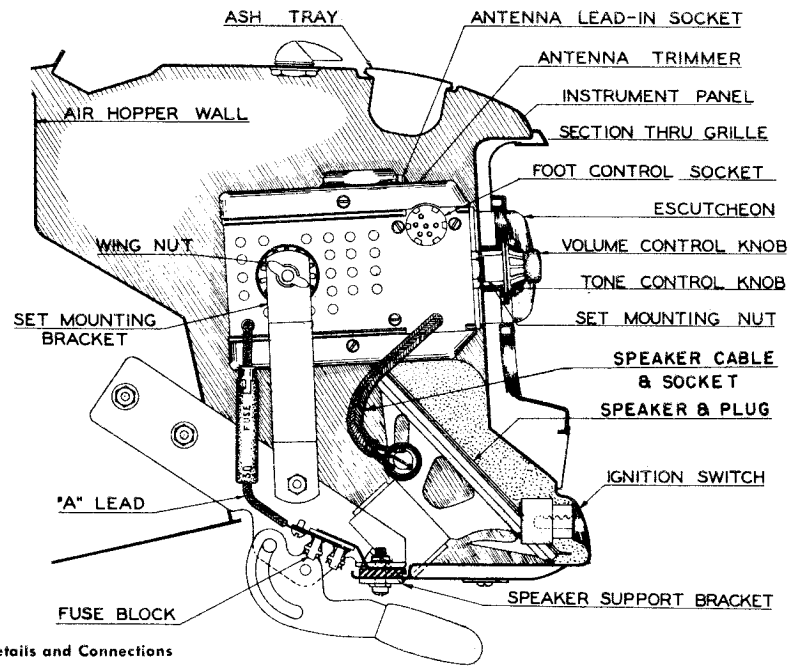

Fig. 2. Mounting Details and Connections

RADIO INSTALLATION INSTRUCTIONS

1. Install the antenna. Complete instructions are packed with each antenna kit.
2. Remove the decorative plate, in the center of the grille, covering the radio opening.
3. Remove the floor mat around the clutch and brake pedals. Place the foot control over the holes provided in the floor board. Fasten it with the three No. 8 R.H. self-tapping screws furnished in the installation kit (Fig. 3).
4. Dress the foot control lead to the left of the clutch pedal and up behind the fire wall pad.
5. Lift the cap from the foot control. Replace the floor mat and cut a hole for the foot control button. To replace the foot control cap, press it firmly and turn until the notches in the cap slip into the flanges on the foot control button.
6. Remove accessory switch bracket.
7. Plug the foot control cable into the socket provided on the left end of the receiver. With this end of the receiver down and the control shafts to the right, push the receiver up between the instrument panel and the air hopper as far as it will go. Turn the radio clockwise until the knob shafts point downward. Lift the front of the receiver up until the shafts slide through the slots provided below the shaft openings in the instrument panel. Bring the receiver forward so that the knob shafts protrude through the shaft openings.
8. Fit the knob shaft bushing nuts on the shafts and tighten as much as possible with the fingers. Place the tips of long nose pliers in the holes in the nuts and tighten securely.
9. Attach set mounting bracket by fastening one end to the side of the receiver case with the wing nut. Fasten the other end of the radio mounting bracket to the cowl ventilator handle bracket with ¼" x ¾" M.S., flat washer, and nut. (Fig. 2.)
10. Remove cardboard protector from speaker unit and fasten speaker and bracket assembly in place with two ¼" x ¾" M.S. flat washers, two lock washers, and two nuts provided. (Fig. 2.) Plug the speaker cable into the socket provided on the speaker frame.
11. Fasten the controls in place as shown in figure 1. NOTE: Tuning knob must be placed 3 16" away from the instrument panel in order to rotate freely in the automatic position.
12. Fasten the accessory switch bracket back in place.
13. Remove the ash tray assembly and plug the antenna lead into the socket provided on the top of the receiver.
14. Fasten the "A" lead to the fuse block as indicated in figure 2.
15. Turn the receiver on and allow it to operate for approximately fifteen minutes in order for it to reach normal operating temperature. Tune in a weak station near 1200 Kc. Reach through the ash tray opening with a small screw driver and adjust the antenna trimmer, located on the top of the receiver, for maximum volume. (Fig. 2.) Replace ash tray.

INTERFERENCE ELIMINATION

IMPORTANT: Use the utmost care in the following operations to insure freedom from motor noise. Be sure that good ground contacts are made between the interference condensers and the car body. If necessary, clean away paint or dirt with emery paper. Tighten all nuts and bolts securely.

1. Remove the top mounting screw of the horn relay near the voltage regulator and under this screw mount the condenser No. 22-1537. Connect the lead to the voltage regulator battery terminal. (Fig. 4.)

2. Install suppressor in center hole of distributor cap. Place high tension lead in the top of suppressor. Be sure the suppressor and the lead are fastened securely. (Fig. 5.)

3. On the six cylinder car, remove the bolt, above the ignition coil, from the firewall. Mount the condenser No. 22-1537 under this bolt. Connect the lead to the coil terminal as shown in figure 6A.

   On the eight cylinder car, remove the bottom screw from the ignition coil mounting bracket. Install the condenser No. 22-1537 under the screw. Connect the lead to the coil terminal as shown in figure 6B.

4. Loosen the upper rear cap screw of the engine water jacket plate. **CAUTION: Do not REMOVE cap screw.** Slide the slotted bracket of the condenser No. 22-1260 under the head of this screw. Tighten the screw.

   Attach the condenser lead to the water temperature element in the head. (Fig. 7A.)

5. Remove the tape from the hole (located near the left rear cylinder head nut) in the dash. Fasten the flat ground strip to this hole with a sheet metal screw and lock washer. On the six cylinder car, place the other end of the strip on top of the regular stud nut, and fasten it in place with the special nut furnished in the installation kit. (Fig. 7A.) On the eight cylinder cars, bolt the other end of the strap under the regular stud nut. (Fig. 7B.)

6. Install the motor hood bond spring No. 80-145 as shown in Figure 8. Fasten with No. 8 sheet metal screw. Part No. 112-365.

PARTS LIST

• 1946 RADIO RECEIVER KIT *
Model DB 46 (Part Number 208815)

Items included in kit are:

- Radio receiver
- Mounting bracket, screws, lockwashers, knobs
- Speaker and bracket assembly
- Foot volume control and switch assembly
- Distributor suppressor
- Temperature gauge condenser
- Ignition coil and generator condenser
- Motor hood bonding spring
- Motor bond strap
- Sheet metal screw
- Nut for 6 cyl. cars
- Lockwasher

RADIO ANTENNA KITS *

Part No. 209558—66" Telescopic Antenna including all installation parts.

Part No. 209762—92" Telescopic Antenna including all installation parts.

Part No. 205451—Vacuum Operated Antenna including all installation parts.

(See antenna kits for full installation instructions.)

NOTE: Kits marked * are not available from the radio manufacturer. See your Hudson dealer.

FIGURE 2

EXPLODED VIEW
FIGURE 3

1. Locate the roof hole by laying the metal template (furnished with the antenna kit) along the upper end of the windshield divider strip as shown in Fig. 1. Prick punch two holes at the word marked "Closed" on template as shown. Be careful not to allow the drill or cutter to punch a hole through the headlining. The accurate drilling of the lower edge of the bottom hole is important for the correct fitting of the roof tube and the smooth operation of the aerial. Cut out the metal between the lines as shown in Fig. 2.

2. Remove rear vision mirror bracket.

3. Remove plastic button from top center instrument board.

4. Loosen sliding tube knob and lower roof tube nut. (See Fig. 4.) (Caution: Upper roof tube nut is not to be loosened at any time!) Allow knob, nut and insulator to slip down and ride loosely on stationary tube. Next slip stationary tube out of the sliding tube and push upper end through hole in moulding behind rear vision mirror until the connector at the bottom of the tube can be dropped into hole in top of instrument panel. Assemble washer and wing nut from below panel.

5. From the outside of the car, thread the sliding tube (complete with roof tube, gasket, stanchion and upper roof tube nut) over the stationary tube which now extends through hole in roof, and lower the assembly into car. Rubber gasket and stanchion should be located properly around hole.

6. Working from the inside of the car, slide the insulator over the roof tube so that the shoulder of the insulator seats well into the hole. Make sure the roof tube does not raise out of the hole during this operation. The lower roof tube nut should be tightened only enough to assure a good moisture seal of exterior parts of aerial.

CAUTION: Be sure that neither the center trim strip bond nor the windshield moulding touches the lower roof tube nut (Fig. 2).

7. Align the sliding tube knob with the lower end of the sliding tube. Tighten using Allen Wrench.

IMPORTANT — KEEP THE INSULATORS FREE FROM OIL OR POLISHING WAX

1- ALL READINGS TAKEN WITH RECEIVER O/A ANTENNA GROUNDED TO CHASSIS (NO SIGNAL)
2- USE A LINE VOLTAGE OF 115 VOLTS OR MAKE ALLOWANCE FOR VARIATIONS.
3- USE A 1000 OHM RESISTANCE VOLTMETER HAVING A RESISTANCE OF AT LEAST 1000 OHMS PER VOLT.
4- TAKE ALL D.C. READINGS ON THE 500 VOLT SCALE.
5- READ FROM INDICATED TERMINALS TO CHASSIS BASE.
6- SEE LOCATION CHART ABOVE FOR POSITION OF TERMINALS

ELECTRICAL SPECIFICATIONS.

TYPE OF CIRCUIT - SUPERHETERODYNE WITH AVC AND PUSH-PULL OUTPUT.
POWER SUPPLY - 115 VOLTS 50-60 CYCLES 60 WATTS
INTERMEDIATE FREQUENCY - 456 K.C.
TUNING RANGE - 535 K.C. TO 1700 K.C.
OUTPUT - 5 WATTS
TUBES USED - ONE 6SA7 DET. OSC., ONE 6SK7 I.F. AMP., ONE 6K6 2ND DET. AVC., ONE 6SC7 1ST AUDIO & PHASE INVERTER, TWO 6K6 PUSH-PULL OUTPUT, ONE SW4 RECTIFIER.

ALIGNMENT OF COMPENSATORS.

1- CONNECT SIGNAL GENERATOR TO ANTENNA LEAD THRU A 100 MMFD CONDENSER. TURN VOLUME CONTROL TO FULL VOLUME POSITION. TURN TONE CONTROL TO TREBLE POSITION. CONNECT OUTPUT METER ACROSS VOICE COIL OF SPEAKER. THE OUTPUT METER SHOULD HAVE A 0-10 VOLT A.C. RANGE.
2- SET SIGNAL GENERATOR TO 456 K.C. ADJUST I.F. TRIMMERS TO MAX. OUTPUT DURING THIS OPERATION READJUST OUTPUT OF SIGNAL GENERATOR TO MAINTAIN METER READING NEAR CENTER OF SCALE OR HIGHER, AS TOO LOW AN OUTPUT METER READING MAY NOT ALLOW ACCURATE ALIGNMENT TO BE OBTAINED.
3- SET SIGNAL GENERATOR TO 1700 K.C. TUNE SET TO HIGH FREQUENCY END. THIS SHOULD LEAVE THE VARIABLE CONDENSER PLATES COMPLETELY UNMESHED. ADJUST OSCILLATOR TRIMMER TO THIS FREQUENCY. RESET SIGNAL GENERATOR TO 1500 K.C. ADJUST OSCILLATOR & R.F. TRIMMERS TO MAX. OUTPUT. THE SET SHOULD NOW TRACK PROPERLY.
4- THE OSCILLATOR CONDENSER-END PLATES HAVE BEEN BENT AT THE FACTORY TO GIVE 1700 K.C. COVERAGE AND TO INSURE CORRECT TRACKING. THESE PLATES NORMALLY WILL NOT REQUIRE ADJUSTMENT. HOWEVER IF THEY HAVE BEEN DISTURBED THROUGH HANDLING THEY WILL REQUIRE TOUCHING UP DURING ALIGNMENT.

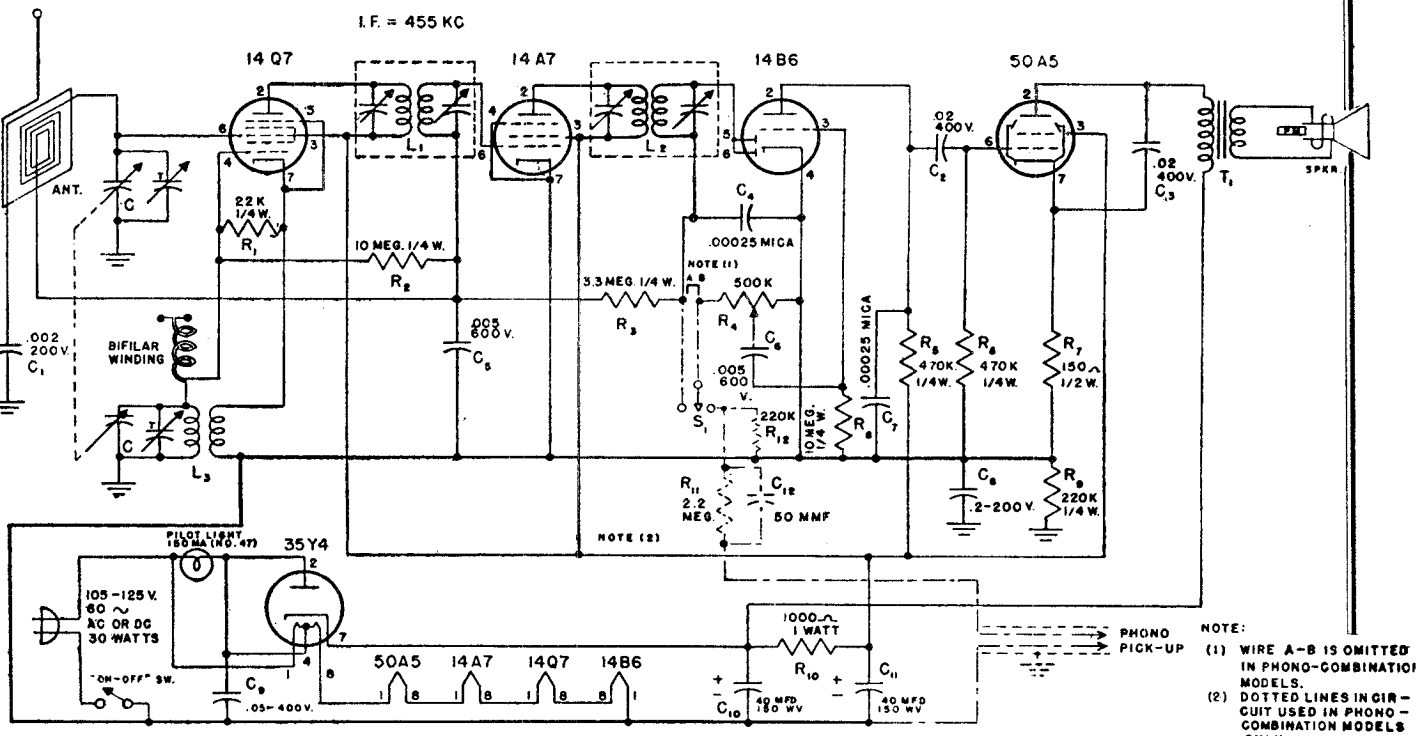
MODELS 651,653,6541, 6547,6545,6560

W. T. KNOTT CO.



NOTE:
(1) WIRE A-B IS OMITTED IN PHONO-COMBINATION MODELS.
(2) DOTTED LINES IN CIRCUIT USED IN PHONO-COMBINATION MODELS ONLY.

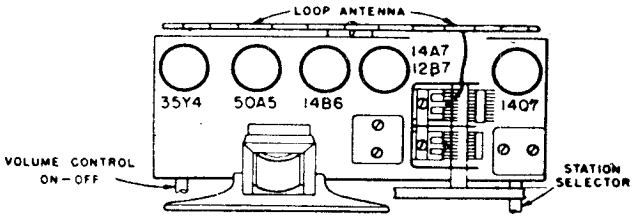
Alignment Procedure:

Steps	Connect output of oscillator to	Tune osc. to	Tune radio dial to	Adjust the following for max. peak output
1.	Tuning condenser stator (ant.) in series with .01 mfd.	455	Quiet point at high frequency end of dial.	1st and 2nd I. F. Transformers
2.	Antenna term. of Ant. loop in series with 100 mmf.	1720	Full clockwise (out of mesh)	Osc. trimmer
3.	Antenna term. of Ant. loop in series with 100 mmf.	1500	1500	Ant. trimmer

Output meter is connected across voice coil. Receiver volume is turned to maximum.

Tube Complement:

1 Type 14Q7—Oscillator—Converter.
1 Type 14A7—I. F. Amplifier.
1 Type 14B6—Det. A.V.C. and Amp.
1 Type 50A5—Power Amp.
1 Type 35Y4—Rectifier.



Nylon cord of the tuning and dial system may be replaced by following the diagram below.

ALIGNMENT

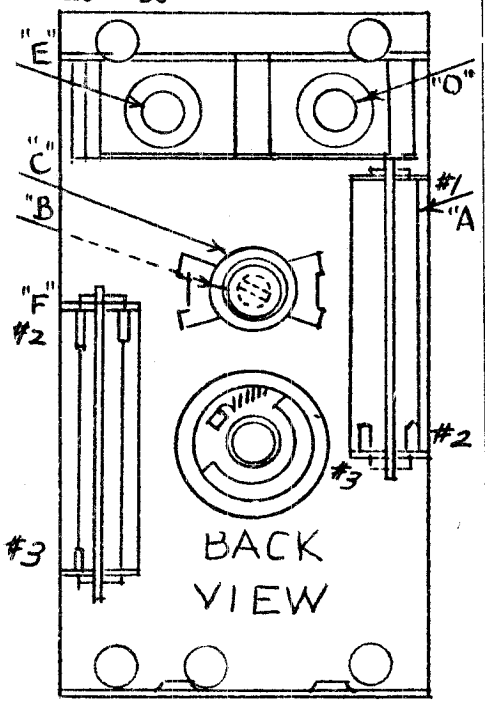
Set volume control at maximum. Connect -B of chassis to ground post of signal generator through a 1-mf condenser. Connect output meter across output transformer secondary.

Dummy antenna --- 250-mmf condenser

Connect AVC diodes(4 and 5 on 12SQ7 tube base) to chassis ground through a 1-megohm resistor. Set signal generator to 456 kc. Feed signal to No.8 pin on 12SK7 through the dummy antenna.
Adjust trimmers on the output i-f transformer to maximum signal.
Remove signal from 12SK7 tube base and place on No.5 pin on 12SA7 socket.
Adjust trimmers on input i-f transformer for maximum signal.
For overall alignment of the i-f transformers, connect the signal generator to the external antenna and retune for maximum output.

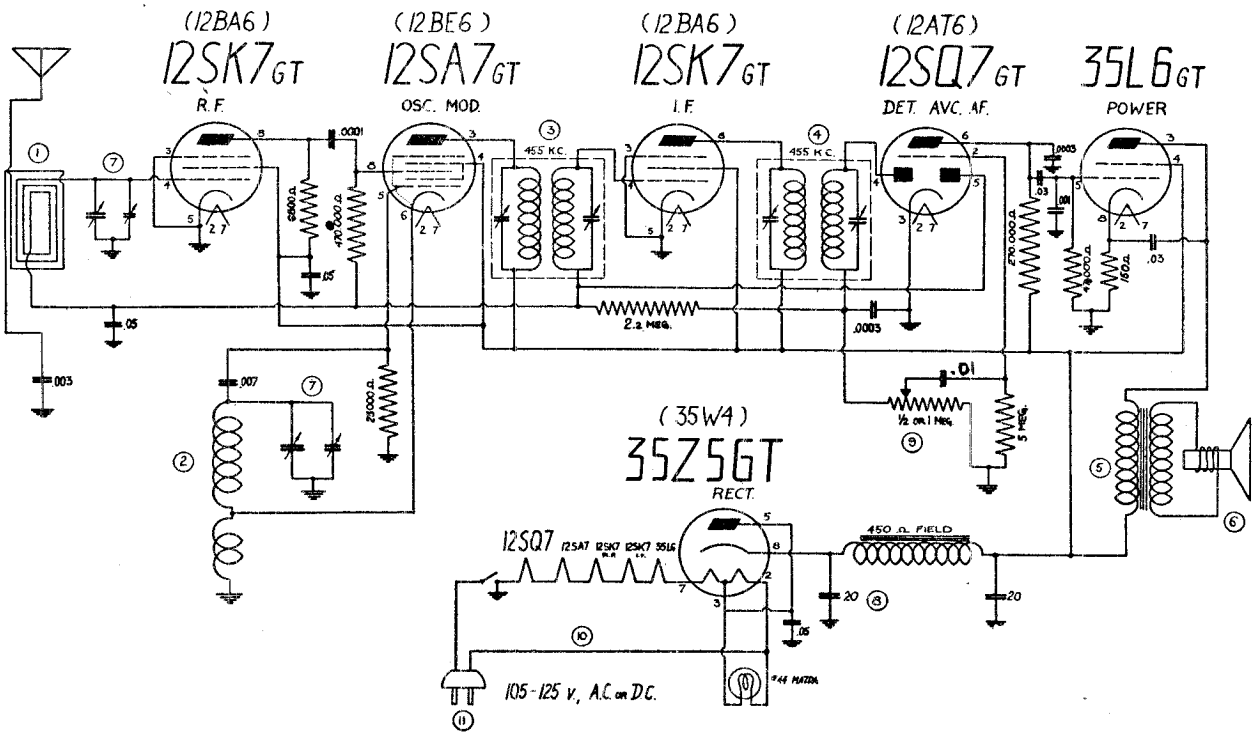
For tracking of the oscillator and r-f coils and trimmers on the tuning assembly proper, proceed as follows:



Center pointer on the scale, making sure that it does not over-ride the scale on either end of the band.
Set pointer to 1400 kc on the dial scale. Set signal generator to 1400 kc.
Connect signal generator to external antenna lead. Do not use dummy antenna.
Adjust oscillator trimmer "E" until maximum output is obtained.
Adjust antenna trimmer "O" until maximum output is obtained.
Reset dial pointer to 750 kc and reset signal generator to 750 kc.
Adjust antenna coil "A"(by loosening screws and sliding the coil form either up or down) until maximum output is obtained.
Reset dial pointer and signal generator to 550 kc.
Adjust screw plunger "B" in the center oscillator coil "C".(Clockwise to raise frequency and counterclockwise to lower frequency.)

©John F. Rider

PURETONE RADIO CORP.



This model is a superheterodyne receiver for regular radio broadcast reception, using latest low drain tubes for low power consumption. A self-contained antenna loop is incorporated which makes the use of an outside antenna unnecessary in most localities. It will function on 105 to 125 volts, 40-60 cycles AC, or 105 to 125 volts DC. A range of 540 to 1600 kilocycles is covered by the receiver.

INSTALLATION

1. Make certain that all tubes are in their proper place and sit secure in their sockets. A sketch, showing their location will be found on this sheet. To exchange tubes, remove the antenna loop by unscrewing the 2 lower screws on the wooden bracket.

2. If found that additional radio signal pick-up is required than is obtained by the inbuilt antenna loop, it is advisable to attach an outdoor aerial to the flexible lead, extended from said loop antenna.

VOLUME CONTROL

The knob on the left hand side is the power switch and volume control. When the control is in the extreme counter-clockwise position the power is "off." From this position, a slight clockwise rotation turns the power "on," and rotating the knob in this direction will increase the volume until full output is obtained.

TUNING CONTROL

The knob on the right hand side is the tuning knob which operates the pointer and tuning condenser. A reduction drive insures easy and accurate selection of all stations within the range of the band. The pointer is phosphor luminous, and will maintain luminous power in the dark, when exposed regularly to bright daylight.

TO CALIBRATE RECEIVER

I. F. Connect antenna lead of the signal generator to R.F. section and ground lead of signal generator to receiver chassis. Connect an output meter across the voice coil. Rotate the volume control to maximum. Apply 455 K.C. signal to control grid of 12SK7 R.F. tube through a .05 capacitor. Second I.F. transformer to be aligned first, then 1st I.F. transformer, by adjusting trimmers.

R.F. Connect antenna lead to antenna, and ground lead of signal generator to receiver chassis. Adjust both generator and receiver to 1600 K.C. Peak oscillator trimmer for maximum output. Set the signal and receiver dial to approximately 1300 K.C. Adjust the antenna trimmer for maximum output.

I.F. ALIGNMENT—Set the gang condenser to minimum capacity. Connect the hot side of the signal generator to stator lug of large condenser section through a .05 mf. condenser, and connect the ground lead of the generator to receiver B minus common. Adjust the four I.F. trimmers for maximum response at 455 kc.

R.F. ALIGNMENT—Set dial pointer at 160. Feed 1600 kc. from the signal generator into a loop of wire approximately one foot in diameter, located about one foot from the receiver loop. Adjust the oscillator trimmer for maximum response.

Set the dial to 140 and adjust the r.f. trimmer for maximum response at 1400 kc.

HOW TO SET PUSH BUTTONS TO FAVORITE STATIONS

1. Turn radio set on and allow it to warm up for at least 15 minutes. This is important.

2. Tune in one particular station carefully with tne tuning control. Reduce the volume with the volume control and make sure that the tuning control is set so that the station is as loud and clear as possible.

3. Unscrew the first button two full turns counterclockwise. Hold the tuning control in its exact position on the station.

4. Push the button all the way in and, while holding the tuning control rigidly, screw in the button clockwise tightening it securely.

5. Check as follows: Detune the station with the manual tuning control; then push the button all the way in to tune in the station.

6. If the station is not tuned as loudly and clearly as possible, readjust as indicated in steps 2, 3, 4, and 5.

7. Readjust the other buttons, each for a different station, in the same manner.

RC150 RECORD CHANGER

IMPORTANT: This manual does not apply to later Record Changers which are similar in appearance. The RC150 can be easily identified by removing the cover assembly (1) and noting the adjusting screws (10).

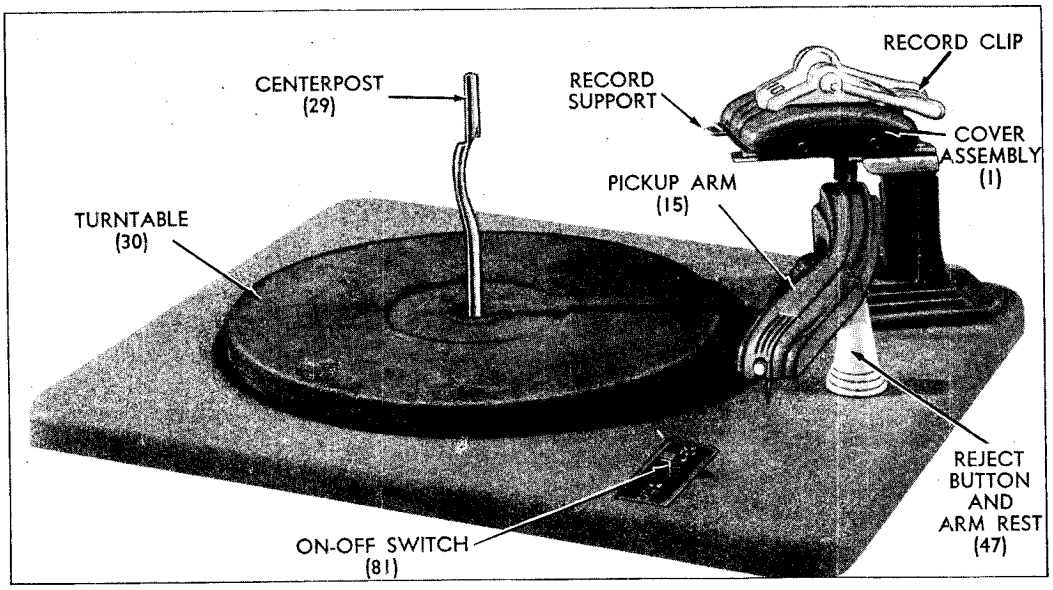

FIGURE 1. RECORD PLAYER, TOP VIEW

OPERATING INSTRUCTIONS

1. SETTING FOR SIZE OF RECORD.

The size of record for which the record changer is set to play is indicated by the number (on the top of the cover assembly) nearest the turntable. See Figure 1.

To change the setting, grasp the record support and cover assembly (1) and rotate it a half turn until it snaps into place with the correct record size toward the turntable. If the record support does not turn all the way around easily, return it to its previous position, and turn on the record changer until the pickup arm moves to its playing position. Turn the record changer off, and lift the pickup arm back to the arm rest. You should now be able to turn the record support to the correct position.

2. STARTING THE RECORD CHANGER.

Before starting the record changer, be sure to set the record clip so that it rests on the top record. Throw the switch to the "ON" position. Then firmly push down on the top of the pickup arm momentarily. This presses down on the reject button and starts a change cycle.

3. STOPPING AND UNLOADING.

(a) After you have finished playing the last record, allow the mechanism to go through its change cycle and begin playing the last record over again. Throw the switch to the "OFF" position and lift the pickup arm over to the arm rest. Turn the record clip to the position furthest away from the turntable.

(b) While holding the records loosely, lift the entire stack straight up, making sure the records are horizontal. This is important because tilting the records or holding them tightly may cause them to bind. The removal of records is made easier by rotating the record support a quarter turn.

CAUTIONS

1. **Never use force to stop the motor or turntable.**
2. **Do not turn off the record changer while it is going through its change cycle but wait until it is playing a record.**
3. **The record changer should always be level when in use.**
4. **When turning the record support, be sure to grip the entire record support and cover assembly and not just the plastic record clip.**

©John F. Rider

MODEL RC150

ADMIRAL CORPORATION

SERVICE INSTRUCTIONS

IMPORTANT: After the record changer or player is repaired, press down the reject button to minimize the danger of damaging the equipment during shipment.

4. DESCRIPTION OF CHANGE CYCLE.

(See Figures 3, 4, 6.)

As the pickup arm moves toward the center of the record, the retaining lever roller (59A) on the end of the trip linkage assembly (59) [which is connected to the pickup arm through the guide pin assembly (25) and lift guide assembly (26)] is gradually withdrawn from behind the stop bracket (40) on the eccentric cam (39). The cam, which no longer is held in place by the retaining lever roller (59A) is pulled over by the eccentric cam spring (43) until the rubber tire makes contact with the knurled roller (66) on the turntable shaft (30A). This knurled roller, which is driven by the turntable shaft, rotates the eccentric cam. This, in turn, will force the riser-plate assembly (60) back along its guide rods (65A) away from the centerpost. As soon as the riser plate begins to move back, the lower lift rod (24) will ride up the inclined surface and cause the pickup arm to be raised clear of the record. Then the motion bracket (60A) on the riser plate contacts the stop arm (59B) of the trip linkage assembly and pushes it back away from the centerpost. This motion of the stop arm (a) carries the pickup arm away from the centerpost and clear of the edge of the turntable; and (b) rotates (counterclockwise) the guide pin assembly (25), which is coupled through the upper lift rod and guide plate assembly (14) to the push-off arm (5). This push-off arm, which has also been raised by the vertical motion of the lower lift rod (24) so that it is in line with the set-down point adjusting screw (10), will push against the screw and cause the push plate (7B) to move forward at the instant that the needle is over the set-down point. Then the push plate will begin to push off the bottom record to the turntable. The pressure of the push plate springs (8 or 8X) will return the push plate (7B) to its normal position and at the same time force the push-off arm (5) back. This, in turn, will move the pickup arm to its playing position directly above the record and return the trip linkage assembly (59) to its normal position. The riser-plate assembly (60) which is propelled toward the centerpost by the guide rod recoil spring (36), will continue to slide forward at the same time that the eccentric cam (39) is completing its revolution. As the riser plate approaches the end of its travel, the lower lift rod (24) slides back down the inclined surface and drops the pickup arm onto the record. As the eccentric cam aided by the eccentric cam spring (43) completes its revolution, the rubber tire of the cam moves away from the knurled roller (66) on the turntable shaft and the stop bracket (40) comes to rest against the retaining lever roller (59A) of the trip linkage assembly. The change cycle is completed.

When the reject button is pressed, the reject trigger wire (50) pulls the trigger (54), releasing the reject slide (51A). As the reject slide is pulled forward by its spring (52) it carries with it the stop arm (59B) of the trip linkage assembly. This starts a change cycle in exactly the same manner as if the pickup arm had been moved to the centerpost. During the next cycle, the reject slide (51A) is forced back by the riser plate motion bracket (60A) and again locked in position by the reject trigger (54).

TOOLS REQUIRED

(Order from your Admiral distributor only)

#6 Bristol Set Screw Wrench (Admiral Part No. P-5805. List Price $0.05)

#8 Bristol Set Screw Wrench (Admiral Part No. P-5806. List Price $0.05)

1/4 inch open end wrench } Two separate wrenches required. Can order
3/16 inch open end wrench } two Admiral Part No. P-5807. Net price $0.35 each.

CAUTION

1. **Do not remove the turntable unless it is absolutely necessary. If its removal is required, take out the centerpost and loosen the set screw in the knurled roller (66) before carefully lifting the turntable.**

2. **See that the drive pulley (73A) and rubber tires on the idler wheel (74) and eccentric cam are kept clean and free from oil, grease, dirt, or any foreign material. Carbona or carbon tetrachloride may be used for cleaning these parts.**

3. **If replacement of any parts requires the removal of the push-off arm (5) or guide pin assembly (25), be sure to re-position or replace these parts as directed in paragraphs 8 and 9 respectively.**

©John F. Rider

ADMIRAL CORPORATION

ADJUSTMENTS

5. SET-DOWN POINT (See Figure 2).

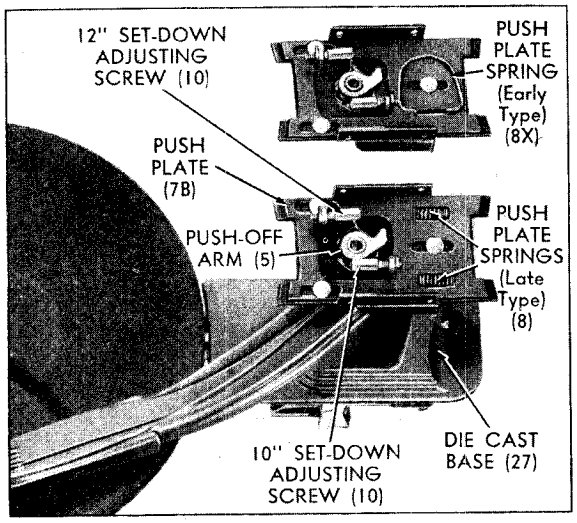
Check paragraphs 12, 13 and 14 before making this adjustment.

Remove the cover assembly (1) by prying out the four round clips (2) at the lower edge of the cover. If the set screws in the push-off arm (5) are loose, see paragraph 8. If they are tight, adjust the set-down point for both ten-inch and twelve-inch records as follows:

(a) Turn the record support to the ten-inch position, place a ten-inch record on the turntable, and turn on the changer. Allow it to go through a change cycle by moving the pickup arm toward the center of the record. *Do not use the reject button.* Note the point on the record at which the needle first makes contact. This point should be 4⅝ inches from the side of the centerpost.

(b) If the set-down point is not correct, loosen the hex lock nut (9) on the set-down point adjusting screw (10) nearest the centerpost. Turn the screw clockwise if the set-down point is less than 4⅝ inches from the centerpost, and counterclockwise if the set-down point is more than 4⅝ inches from the centerpost. One full turn of the screw will move the set-down point about 7/32 inch.

(c) Tighten the hex nut (9), turn on the changer, and allow it to go through a change cycle, again noting the point at which the needle first touches the record.



12" SET-DOWN ADJUSTING SCREW (10)
PUSH PLATE SPRING (Early Type) (8X)
PUSH PLATE (7B)
PUSH-OFF ARM (5)
PUSH PLATE SPRINGS (Late Type) (8)
10" SET-DOWN ADJUSTING SCREW (10)
DIE CAST BASE (27)

FIGURE 2. RECORD CHANGER, TOP VIEW SHOWING LOCATION OF PARTS

If the set-down point is still incorrect, repeat the above procedure.

(d) Rotate the record support to the twelve-inch position and place a twelve-inch record on the turntable. Repeat the above procedure to adjust the changer for the twelve-inch set-down point, using the other set-down point adjusting screw (10). Adjust it so that needle first touches the record 5⅝ inches from the side of the centerpost.

(e) Check the set-down points using the reject button. If satisfactory, seal the adjustments with a drop of speaker cement. If not, see paragraph 13.

NOTE

When replacing the cover assembly (1) be sure that the indicated record size corresponds to the size for which the record support is set.

6. PICKUP POINT (See Figure 3).

Adjust the pickup point by turning the pickup point adjusting screw (42) on the bottom of the eccentric cam (39). Turn the screw clockwise to delay the pickup point and counterclockwise to hasten it. The change cycle should start when the needle is 1⅝ inches from the side of the centerpost. After properly making this adjustment, seal it with speaker cement.

7. PICKUP ARM HEIGHT.

To vary the height of the pickup arm, adjust the knurled head adjusting screw (20) under the pickup arm (see figure 3). However, check and see if the needle (⅝ inch recommended) is set into the pickup cartridge as far as possible. The proper height of the needle, with the pickup arm hanging free, is 1/16 inch below the top of the turntable.

(a) If pickup arm is raised too high and does not properly make contact with a single record, turn the adjusting screw (20) in a clockwise direction until the pickup arm is at the proper height.

(b) If pickup arm is not raised high enough and results in either needle back-scratch or failure of the pickup arm to clear the arm rest (47), turn the knurled head adjusting screw (20) counterclockwise until the pickup arm is raised to the required height. Back-scratch may sometimes be eliminated by replacing an extra-long needle with a ⅝-inch needle.

ADMIRAL CORPORATION

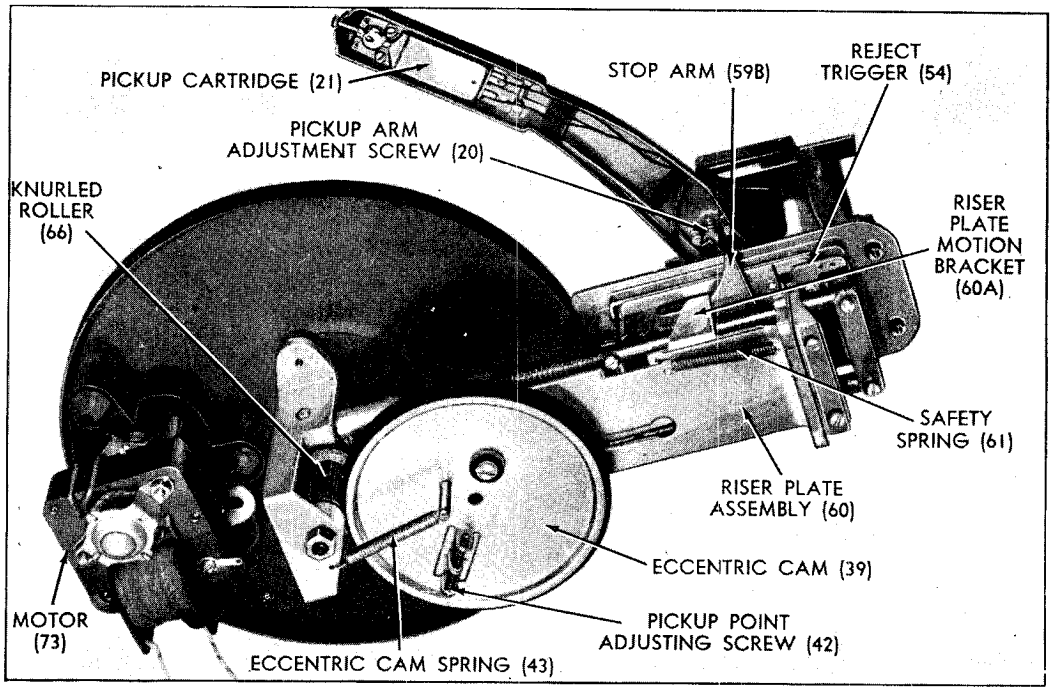

FIGURE 3. RECORD CHANGER, BOTTOM VIEW SHOWING LOCATION OF PARTS

SERVICING AND REPAIR

8. RE-POSITIONING PUSH-OFF ARM (Figures 2 and 4).

This must be carefully done if set screws are loose or push-off arm has been removed.

(a) Loosen the two set screws in the push-off arm (5) with the No. 6 Bristol wrench.

(b) Turn the record support to the 12-inch position.

(c) Place a 12-inch record on the turntable.

(d) Move the pickup arm to the centerpost. Rotate turntable by hand in its normal direction until the needle is directly over the point on the edge of the record at which it would set down at the beginning of the next playing cycle. Be sure the pickup arm is stopped when it is moving *away* from the centerpost.

(e) Set the point of the push-off arm (5) in light contact with and slightly below the center of the 12-inch set-down point adjusting screw (10). Now tighten both of the push-off arm set screws.

(f) Re-adjust the set-down points for both the 10-inch and 12-inch positions as outlined in paragraph 5.

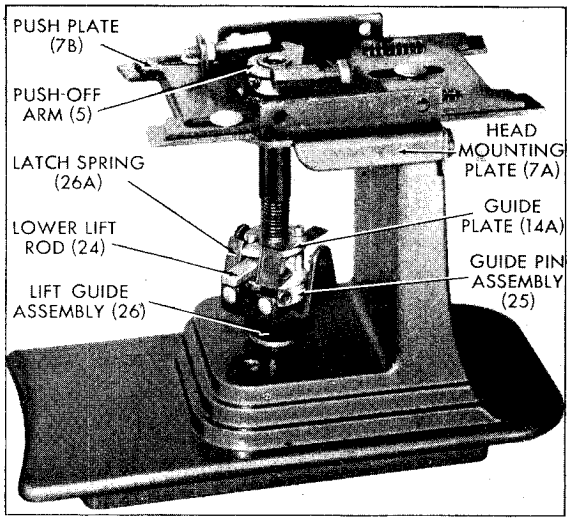

FIGURE 4. PUSH-OFF ARM, UPPER LIFT ROD, AND GUIDE PIN ASSEMBLY

9. RE-POSITIONING GUIDE PIN ASSEMBLY (Figure 5).

This must be carefully done if set screws are loose or guide pin assembly has been removed.

(a) Carefully remove the head assembly (7) as well as the upper lift rod and guide plate assembly (14) by taking out the two binder head screws (28) near the top of the die cast base (27).

(b) Remove the pickup arm by prying the pivot spring (17) away from the pins on the lift guide assembly (26).

(c) Press the reject button, and rotate turntable by hand in its normal direction until the riser plate assembly (60) underneath the changer (see figure 3) is moved to that point of its travel most distant from the centerpost. Rotate the turntable until the riser plate assembly goes back slightly (not over 1/32 inch).

(d) With the thumb of the left hand, push the stop arm (59B) as indicated at point "A" (figure 5) against the riser plate motion bracket (60A) and upward toward the base (27).

©John F. Rider

ADMIRAL CORPORATION

SERVICING AND REPAIR (Continued)

(e) Rotate the lift guide assembly (26) counterclockwise until it strikes the stop pin (27A) projecting from the base. Also rotate the guide pin assembly (25) counterclockwise as far as it will go until it strikes against the lower lift rod assembly (24).

(f) Maintain these positions as well as that of the stop arm (59B) of the trip linkage assembly (step d). Now press down on the guide pin assembly (25) as indicated at points "B" (figure 5) with the index finger of the right hand so as to leave very little play between the lift guide assembly (26) and the die cast base (27), and tighten the set screw in the guide pin assembly with the thumb and second finger of the right hand. While tightening this set screw, exert pressure on the Bristol wrench in a counterclockwise direction as indicated at "C" (figure 5). Then tighten the other set screw.

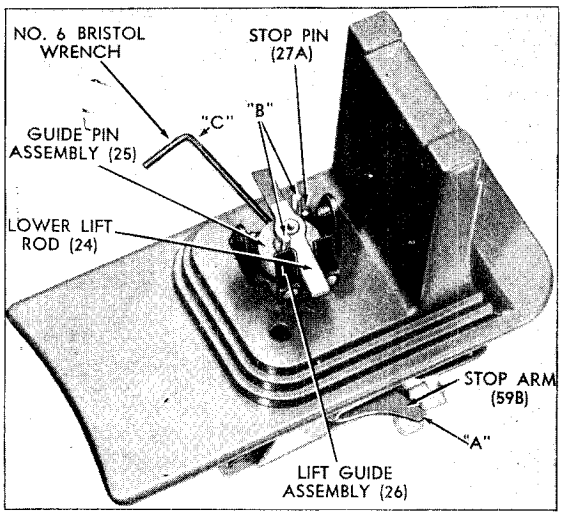

FIGURE 5. RE-POSITIONING GUIDE PIN ASSEMBLY

10. TURNTABLE FAILS TO ROTATE.

Check the following:

(a) Turntable may have worked up, allowing idler wheel (74) to slip out from under it. To correct this, press the idler wheel back in place with a screw-driver, and push the turntable down over it. To remove any play, loosen the set screw in the knurled roller (66), move the roller up on the turntable shaft (30A), and tighten the set screw.

(b) Changer may have been turned off during a change cycle. To start, rotate turntable by hand. Always allow the changer to complete a change cycle before turning it off.

(c) The motor mounting plate may be bent. Correct by removing motor and straightening plate; in some cases it may be necessary to install a new motor.

(d) The idler wheel mounting plate may be caught between the motor mounting plate and the top panel. It may be necessary to raise the motor by removing a shim washer from each of the three mounting screws (78).

(e) Motor may be stalled because its shaft is binding against the upper bearing. Due to some physical shock, the rotor has been forced against the upper bearing to the point where the tapered shoulder on the rotor shaft binds in the bearing itself. This condition may be corrected by dropping the entire changer gently to the surface of a table, thereby forcing the rotor away from the upper plate; or the rotor may be carefully pried down from the upper bearing with a screw-driver.

(f) Motor may be defective. Replace motor.

(g) Turntable shaft (30A) binds. Binding may result if the turntable has ever been removed. Check to see if a burr on the turntable shaft has scored the upper bearing in the turntable mounting (65).

Binding may also result if the turntable shaft (30A) fits too tightly into the bearing of the turntable mounting (65). To rectify this condition, remove turntable, clean the shaft with a piece of extremely fine emery cloth or polishing paper, and file off the burr left by the set screw. Also use a smooth blade of a pocket knife and carefully scrape out the bearing to remove loose zinc particles. Clean bearing and shaft with a solvent such as Carbona or lacquer thinner. Lubricate with a thin film of grease and re-assemble. DO NOT USE EMERY CLOTH OR ANY OTHER ABRASIVE ON THE BEARING.

11. PICKUP ARM REMAINS AT REST POSITION AFTER CHANGER BEGINS ITS CHANGE CYCLE OR REJECT BUTTON HAS BEEN PUSHED.

(a) If turntable is rotating, check for loose set screws in the push-off arm (5). To re-position the push-off arm follow the instructions given in paragraph 8.

(b) If the turntable is rotating, see if the brazed guide plate (14A) has come loose from the upper lift rod. If it has, replace the upper lift rod and guide plate assembly (14).

12. THE 12-INCH SET-DOWN POINT DIFFERS WITH COVER ASSEMBLY OFF AND ON.

The 12-inch set-down point adjusting screw (10) may be touching the cover assembly (1) during the change cycle. Correct by filing down the end of the screw until it clears.

13. PICKUP ARM SET-DOWN POINT DIFFERS FOR MANUAL REJECTION AND AUTOMATIC CYCLE.

(a) Latch spring (26A) requires adjustment. Raise the pickup arm and bend the left leg of flat "U"-shaped latch spring back as far as possible with a screw-driver so that the lip of the guide plate (14A) will engage the latch spring (26A). See figure 4.

(b) Loose or improperly set push-off arm (5). To re-position, see paragraph 8.

(c) Loose or improperly set guide pin assembly (25). To re-position, see paragraph 9.

©John F. Rider

MODEL RC150

ADMIRAL CORPORATION

SERVICING AND REPAIR (Continued)

14. SET-DOWN POINT IS ERRATIC ON BOTH 10-INCH AND 12-INCH RECORDS.

(a) Push plate springs (8 or 8X) may not provide sufficient tension. There should be no "slop" in the head assembly (7) between cycles. If there is any play, replace the push plate springs. See figure 2.

(b) Loose push-off arm (5). To re-position, see paragraph 8.

(c) Loose guide pin assembly (25). To re-position, see paragraph 9.

15. BOTTOM RECORD OF STACK FAILS TO DROP TO TURNTABLE.

(a) Check for a warped record and also see that the record clip (figure 1) is resting on the top record of the stack.

(b) If the record is not warped, and if the record clip is in the proper position, see if centerpost is bent toward the record support (see paragraph 16).

(c) Push plate (7B) may be inoperative. Check the push-off arm (5). If it is loose, re-position per instructions in paragraph 8.

16. CHECKING FOR A BENT CENTERPOST.

With a properly aligned centerpost, a new record (one whose center hole is not worn or enlarged), when pushed all the way into the offset on the centerpost, will rest on the record support and clear the push plate (7B) by 1/32 inch. This measurement should NOT be made during a change cycle because the push plate leaves its normal rest position and moves toward the centerpost to drop a record to the turntable.

If the clearance between the record and the pusher is not 1/32 inch or if the record rests unevenly on the record support, bend the centerpost until the proper clearance is obtained. When bending the centerpost, do not apply pressure above the offset or it may break.

17. RECORD SUPPORT CANNOT BE ROTATED FOR SIZE CHANGE.

Changer may have been turned off during a change cycle. Return the record support to its original position, start changer, and allow it to complete the change cycle. Turn the changer off and return the pickup arm to its rest position. The record support may now be rotated for size change.

18. CHANGER STARTS TO CYCLE WHEN RECORD SUPPORT IS ROTATED FOR SIZE CHANGE.

The push-off arm (5) is being tripped by the set-down point adjusting screw (10). This can be corrected by bending the adjusting screw upward until it clears the push-off arm, except during a change cycle. Now re-adjust set-down points as described in paragraph 5.

19. CHANGER WILL NOT GO INTO CHANGE CYCLE.

(a) Eccentric cam (39) may not be contacting knurled roller (66) on turntable shaft (30A). Eccentric cam spring (43) may be broken or have lost its tension; cam may be binding at its pivot. Correct by replacing spring or eliminating bind.

(b) Set screw on knurled roller (66) may be loose. Move up the knurled roller and tighten the set screw.

(c) Pickup point adjusting screw (42) is too far out of adjustment in a clockwise direction. Adjust the screw so that the change cycle starts when the needle is 1⅝ inches from the side of the centerpost.

20. CHANGER REPEATEDLY GOES INTO CHANGE CYCLE WITHOUT PLAYING RECORD.

Pickup point adjusting screw (42) is too far out of adjustment in a counterclockwise direction. Adjust the screw so that the change cycle starts when the needle is 1⅝ inches from the side of the centerpost.

21. WOBBLY PICKUP ARM.

The binder head screw on the rear of the pickup arm is loose and should be tightened. The more recent changers have eliminated this problem by replacing the screw with rivets (16).

22. NOISY OPERATION.

(a) The turntable may "ring" if the idler wheel tire is bumpy or slightly out of round. Replace the idler wheel (74).

(b) Changer may squeak when carrying a stack of records. Apply a coat of floor wax, furniture wax, paraffin or vaseline to the centerpost. Several applications may be necessary in order to eliminate the squeak.

(c) "Wow" may be due to a warped record, a sprung turntable, or a bumpy or out-of-round idler wheel tire. Replace defective part.

"Wow" may also be caused by an off-center or bent centerpost. If the centerpost is off-center in turntable hole, loosen hex nut (68) and re-position centerpost. If centerpost is bent, see paragraph 16.

(d) The metal of the eccentric cam may rub on the knurled roller (66). The rubber tire (44) on the cam should be replaced. The cam must be removed from the changer to make this replacement.

23. REPLACING DEFECTIVE PICKUP CARTRIDGE.

Before replacing a suspected defective pickup cartridge (21), check for a short or open circuit in the shielded output cable and output plug (79). Also check for an open or short circuit in the leads running from the pickup cartridge to the shielded cable.

©John F. Rider

ADMIRAL CORPORATION

SERVICING AND REPAIR (Continued)

Some changers have a flat metal plate mounted between the pickup cartridge (21) and the pickup arm. When replacing a pickup cartridge, this plate should be removed since replacement cartridges are designed to be used without it. If it is necessary to remove the pickup arm to gain access to the pickup cartridge, follow the procedure as outlined in steps (a) and (b) under paragraph 9.

24. TILTED TURNTABLE.

A tilted turntable does not necessarily indicate a defective changer, since this was normal on early models.

25. IDLER WHEEL POSITION.

The idler wheel (74) should contact the turntable halfway up the rim of the latter. This point of contact was somewhat below center on early models. If necessary, the idler wheel may be raised or lowered by removing or adding shim washers (63) between the motor mounting plate and top panel.

The turntable may be raised or lowered by adding or removing washers between the turntable thrust bearing (32) and the turntable.

26. LUBRICATION.

Under normal operating conditions, the motor should never require oiling. The rest of the changer, however, should be lubricated with grease whenever it comes into the shop for repairs or adjustment. Care should be taken to prevent any of the lubricant from coming into contact with the drive pulley (73A), the idler wheel tire, or the eccentric cam tire.

27. REPLACEMENT OF 60-CYCLE, COIL SPRING DRIVE PULLEY ON MOTOR 407B3.

Only earlier changers used this part.

(a) Remove the motor from the top panel by unscrewing the 3 mounting screws (78).

(b) Remove the 60-cycle, coil spring drive pulley with a pair of pliers. Using a screw-driver, carefully pry off the 9/16 inch diameter washer beneath the pulley.

(c) Next place the new cylindrical drive pulley (73A) on the motor shaft. Set the pulley so that the two ears will line up with the slot on the top of the shaft.

(d) Push the drive pulley down with a Spintite wrench or a piece of hollow tubing. Tap the Spintite wrench or tubing to force the pulley down until it is flush with the end of the motor shaft.

(e) Bend the ears down into the slot on the end of the shaft.

28. CONVERTING MOTOR FOR 50-CYCLE OPERATION.

(Conversion springs are listed at end of Parts List.)

(a) Remove the motor from the top panel by removing 3 mounting screws (78).

(b) If motor shaft has a 60-cycle, coil spring drive pulley, remove the coil spring. After removing coil spring from motor 407B3, be sure to replace it with a cylindrical drive pulley (73A) as per paragraph 27.

(c) Hold the idler wheel (74) away from the drive pulley with the index finger of the left hand, and prevent the armature from turning by holding the motor fan with the left thumb. Now install the 50-cycle conversion spring by twisting it counterclockwise and pushing it down over the cylindrical drive pulley (73A) until its end is flush with the motor shaft. If the conversion spring has a projecting end—cut it off smoothly with a pair of side cutters.

NOTE

Care should be taken to prevent any grease or oil from coming into contact with the idler wheel tire or the eccentric cam tire.

4	414A4	Spring rod (record clip)
5	G400A31	Push-off arm assembly (When replacing, refer to paragraph 8)
6	1A44-38	Set screw (Bristol Head #6-32x3/16")
7	G400B51	Head assembly (Includes 7A, 7B, 8, 9, 10 and 11)
7A	G400A30	Head mounting plate assembly (Also part of 7)
7B		Push plate (Part of 7)
8	405A33	Spring, push plate (Also see 8X)
8X	405A17	Spring, push plate (Early type; located on top of push plate)
9	2A1-10-47	Hex nut (#6-32)
10	402A32	Adjusting screw, set-down point
11	405B18	Spring, head mounting plate (Located on bottom of head mounting plate assembly)
12	402A40	Spacer, upper lift rod
13	405A20	Spring, upper lift rod
14	G400A35	Upper lift rod and guide plate assembly
14A		Guide plate (Part of 14)
15	G400A62	Pickup arm and pivot spring assembly (Does not include 18, 19, 20 or 21)
16	6B1-36-47	Rivet (pickup arm pivot spring)
17	405A2	Pivot spring (pickup arm)
18	405A13	Spring clip (pickup arm)
19	405A29	Lock spring, pickup arm adjustment
20	402A17	Screw, knurled head (#8-32x9/32"; pickup arm adjustment)
21	409A3 Pickup cartridge 409A2 Pickup cartridge 409A1 Pickup cartridge	Interchangeable (Before replacing, see paragraph 23)
22	42-250-C2-47	Screw (Fil.H.M.S. #4-40x1/4"; for mtg. cartridge)
23	402A43	Needle screw for cartridge
24	G400A34	Lower lift rod assembly
25	G400A32	Guide pin assembly (When replacing, see par. 9)
26	G400A10	Lift guide assembly
26A		Latch spring, pickup arm (Part of 26)
27	G400A64	Base (die cast)
27A		Stop pin (Part of 27)
28	65-312-C2-47	Screw (B.H.M.S. #6-32x5/16"; for mtg. assembly 7)
29	G400A12	Centerpost
30	G400B49	Turntable
30A		Turntable shaft (Part of 30)
31	412A1	Cork washer (3/32" thick)
32	415A2	Thrust bearing assembly (Replace as a unit)
33	412A9	Cork washer (3/64" thick)
34	404A1	Riser plate support
35	62-250-C2-21	Screw (Fil.H.M.S. #6-32x1/4"; for mtg. riser plate)
36	405A9	Spring, recoil
37	404A3	Support, eccentric cam
38	401A27	Ferrule, guide rod stop
39	G400A45	Eccentric cam and tire assembly
40	401A58	Stop bracket
41	405A10	Spring, stop bracket
42	60-1125-C2-21	Screw (R.H.M.S. #6-32x1 1/8"; for adj. pickup point)
43	405A8	Spring, eccentric cam
44	406A1	Rubber tire, eccentric cam
45	4B1-57-47	Flat washer (eccentric cam)
46	84-250-C2-21	Screw (R.H.M.S. #8-32x1/4"; for mtg. eccentric cam)
47	G400A46-1 Reject housing assembly (For metal base) G400A46-2 Reject housing assembly (For wood or plastic base)	
48	G400A61	Reject lever assembly
49	405A25	Spring, reject lever
50	414A8	Reject trigger wire
51	G400A54	Reject bracket assembly
51A		Reject slide (Part of 51)
52	405A23	Spring, reject slide
53	62-500-C2-21	Screw (Fil.H.M.S. #6-32x1/4"; for mtg. guide rod)
54	401A70	Reject trigger
55	405A24	Spring, reject trigger
56	405A22	Spring washer (reject trigger)
57	4B1-68-47	Flat washer (reject trigger)
58	405A15	Spring, hairpin
59	G400A4	Trip linkage assembly (Some early models were furnished with a flat washer. Omit washer only if new part is installed.)
59A		Roller, retaining lever (Part of 59)
59B		Stop arm (Part of 59)
60	G400A9	Riser plate assembly
60A		Riser plate motion bracket (Part of 60)
61	405A7	Spring, safety
62	406A6 Rubber grommet (Small; used with metal base) 406A2 Rubber grommet (Used with wood or plastic base)	
63	4B1-36-47	Flat washer
64	60-250-C2-47 Screw (R.H.M.S. #6-32x1/4"; used for mounting record changer on metal base) 260-687-C2-2 Screw (R.H.M.S. Sems #6-32x11/16"; used for mounting record changer on wood or plastic base)	
65	G400B56	Turntable mounting and guide rod assembly
65A		Guide rods (Part of 65)
66	402A5	Knurled roller, turntable shaft (Two lengths are used: 29/32" and 31/32". Omit the cork washer above the roller when using the 31/32" roller.)
67	1A44-13	Set screw (Bristol #8-32x1/8"; for knurled roller)
68	402A41	Hex nut (1/4"-20; used on centerpost)
69	406A5 Rubber grommet (Large; used with metal base) 406A2 Rubber grommet (Used with wood or plastic base)	
70	402A36 Spacer, mounting (Used with metal base) 29A2-4-21 Spacer, mounting (Used with wood or plastic base)	
71	401A75	Spacer, reject trigger
72	80-1000-C2-47 Screw (R.H.M.S. #8-32x1"; used for mounting record changer on metal base) 280-875-C2-2 Screw (R.M.H.S. Sems #8-32x7/8"; used for mounting record changer on wood or plastic base)	
73	407B3	Motor; 105-125 volts, 60 cycle (Motors 407B1 and 407B2 are interchangeable with 407B3)
73A	401A48	Drive pulley (Part of 73. For motor 407B3 only.)
74	G400A23 Idler wheel assembly (Used with motor 407B3 only) G400A57 Idler wheel assembly (Used with motor 407B1 only) G400A59 Idler wheel assembly (Used with motor 407B2 only)	
75	405A14 Spring, idler wheel (Used with motor 407B3 only) 405A35 Spring, idler wheel (Used with motor 407B1 only) 405A36 Spring, idler wheel (Used with motor 407B2 only)	
76	406A4 Rubber grommet (motor mounting; for motor 407B3) 406A9 Rubber grommet (motor mounting; for motor 407B1) 406A10 Rubber grommet (motor mounting; for motor 407B2)	
77	401A53 Spacer, grommet (Used with motor 407B3) 402A44 Spacer, grommet (Used with motor 407B1) 402A45 Spacer, grommet (Used with motor 407B2)	
78	60-875-C2-4 Screw (R.H.M.S. #6-32x7/8"; used for mounting motor on metal base) 60-1125-C2-21 Screw (R.H.M.S. #6-32x1 1/8"; used for mounting motor on wood or plastic base)	
79	89A5-9	Shielded output cable and plug (Used on models 5RP47, 6RC45 and 6RC46 only)
80	88A2-1	Plug (output)
81	77A1-15	Switch, On-Off (Used on model 5RP47 only)
82	12A3-4	Rubber bumper (Used on model 5RP47 only)
83	1A20-14-21 Screw (#6x3/8" drive screw; used for reject lever mounting on metal base) 1A20-18-21 Screw (#6x7/8" drive screw; used for reject lever mounting on wood or plastic base)	
84	29A2-6-21	Spacer, mounting (Used with wood or plastic base)
	405A30	50 cycle conversion spring (For motor 407B1)
	405A31	50 cycle conversion spring (For motor 407B2)
	405A32	50 cycle conversion spring (For motor 407B3)

MODEL RC150

ADMIRAL CORPORATION
TROUBLE CHART

TROUBLE	CAUSE	REMEDY
Pickup arm sets down at wrong point on record even though the changer is reasonably level.	The set-down point requires adjustment.	See paragraph 5.
Pickup arm lifts at wrong point on record (change cycle starts too soon or too late).	Pickup point requires adjustment.	See paragraph 6.
Needle does not make contact when in playing position over a single record.	Pickup arm raised too high. Knurled adjusting screw (20) needs adjustment.	See paragraph 7(a).
Pickup arm does not clear arm rest.	Knurled adjusting screw (20) needs adjustment.	See paragraph 7(b).
Needle back-scratch.	Needle may be too long.	Use 5/8 inch needle.
	Pickup arm does not raise high enough.	See paragraph 7(b).
Push-off arm (5) in wrong position.	Loose or improperly set push-off arm.	See paragraph 8.
Guide pin assembly (25) in wrong position.	Loose or improperly set guide pin assembly.	See paragraph 9.
Turntable fails to rotate.	Various causes.	See paragraph 10.
Changer slows up while playing records.	Turntable shaft binds.	See paragraph 10(g).
	Centerpost is off-center or bent.	See paragraph 16.
Pickup arm remains at rest position after changer begins its change cycle or reject button has been pushed.	If turntable is rotating, look for loose set screws in the push-off arm (5).	See paragraph 8.
	Guide plate (14A) has come loose from upper lift rod.	Replace upper lift rod and guide plate assembly (14).
The 12-inch set-down point differs with cover assembly (1) off and on.	The 12-inch set-down adjusting screw may be touching cover assembly (1) during change cycle.	File down the end of the screw until it clears.
Pickup arm set-down point differs for manual rejection and automatic cycle.	Latch spring (26A) requires adjustment.	See paragraph 13.
	Loose or improperly set push-off arm (5).	See paragraph 8.
	Loose or improperly set guide pin assembly (25).	See paragraph 9.
Set-down point is erratic on both 10-inch and 12-inch records.	Push plate springs (8) may not provide sufficient tension.	See paragraph 14(a).
	Loose push-off arm (5).	See paragraph 8.
	Loose guide pin assembly (25).	See paragraph 9.
Bottom record of stack fails to drop to turntable.	Push-off arm may be loose.	See paragraph 8.
	Warped record. Record clip in wrong position.	See paragraph 15.
	Centerpost may be bent toward record support.	See paragraph 16.
Centerpost and record support too far apart.	Centerpost bent away from record support.	See paragraph 16.
Record support cannot be rotated for size change.	Changer turned off during a change cycle.	See paragraph 17.
Changer starts to cycle when record support is rotated for size change.	Push-off arm (5) is being tripped by the set-down point adjusting screw.	See paragraph 18.
Changer will not go into change cycle.	Eccentric cam may not be contacting knurled roller on turntable shaft.	See paragraph 19(a).
	Set screw on knurled roller may be loose.	See paragraph 19(b).
	Pickup point adjusting screw (42) is too far out of adjustment in a clockwise direction.	See paragraph 19(c).
Changer repeatedly goes into change cycle without playing record.	Pickup point adjusting screw (42) is too far out of adjustment in a counterclockwise direction.	See paragraph 20.
Wobbly pickup arm.	Binder head screw on rear of pickup arm is loose. (The later changers have eliminated this problem by using rivets (16) in place of this screw.)	Tighten screw.
Turntable "rings".	Idler wheel (74) bumpy or out-of-round.	Replace idler wheel.
Changer squeaks.	Centerpost needs lubrication.	See paragraph 22(b).
"Wow".	Warped record; sprung turntable; bumpy or out-of-round idler wheel.	Replace defective part.
	Centerpost off-center or bent.	See paragraph 22(c).
Hum.	Open shield lead of output cable (79).	Replace cable.
Changer operates mechanically but has weak or no electrical output.	Shorted or open pickup leads or shielded cable.	Replace defective part.
	Defective pickup cartridge.	See paragraph 23.
	Open shield lead of output cable (79).	Replace cable.
	High-resistance connection due to improper soldering.	Re-solder.
	Leakage through output plug (80).	Replace plug.
Changer operates mechanically but has a distorted electrical output.	Defective pickup cartridge.	See paragarph 23.

ADMIRAL CORPORATION

RC160 RECORD CHANGER

IMPORTANT

The RC160 Record Changer is similar in appearance to other Admiral changers. To be certain which model changer you are servicing, look for the changer model number which appears on the small label attached to the underside of the changer mechanism. The changer can be further identified by comparing Figures 3 and 5 with the actual changer.

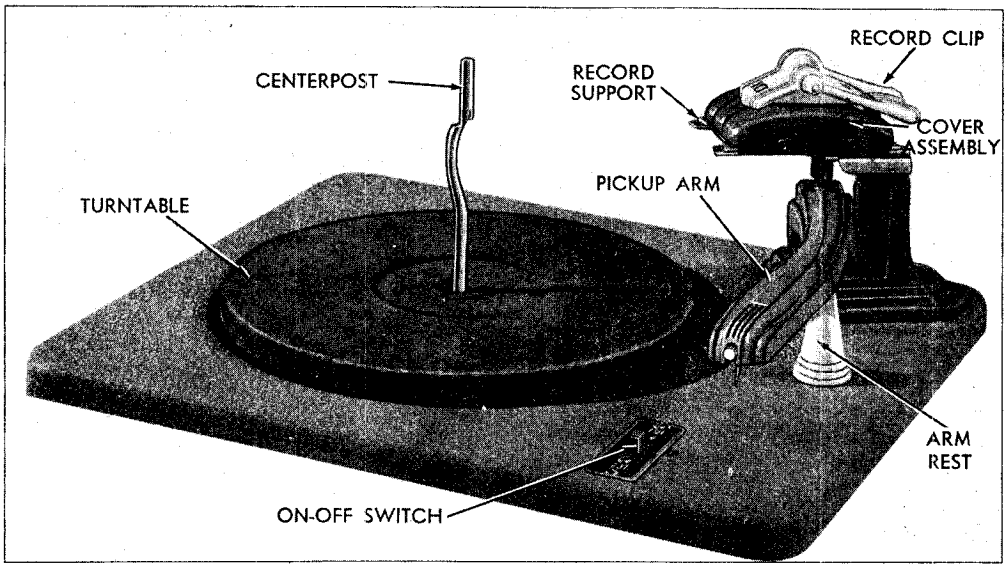

FIGURE 1. RECORD PLAYER, TOP VIEW

OPERATING INSTRUCTIONS

1. SETTING FOR SIZE OF RECORD.

The size of record for which the record changer is set to play is indicated by the number (on the top of the cover assembly) nearest the turntable. See Figure 1.

To change the setting, grasp the record support and cover assembly and rotate it a half turn until it snaps into place with the correct record size toward the turntable. **In changing the setting from 10-inch to 12-inch, rotate the assembly counterclockwise only; in changing from the 12-inch to the 10-inch setting, rotate the assembly clockwise only.**

2. STARTING THE RECORD CHANGER.

Load the record changer and set the record clip so that it rests on the top record. Before turning on the ON-OFF switch, firmly grasp the pickup arm, move it slightly to the right of the arm rest and then return the pickup arm to a point near the edge of the turntable before releasing it. While moving the arm, it should be held firmly enough to prevent it from snapping back and causing possible damage to the needle.

Now turn on the ON-OFF switch. The entire stack of records will then be played automatically.

3. REJECTING A RECORD.

To reject a record at any time and start playing the next one, firmly grasp the pickup arm, move it above and slightly to the right of the arm rest and return the pickup arm to a point near the edge of the record before releasing it. While moving the arm, it should be held firmly enough to prevent it from snapping back.

4. UNLOADING RECORDS.

To remove the records, it is advisable to have the changer mechanism out of cycle. However, it is possible to unload the changer while it is in cycle so long as the pickup arm is clear of the records.

Turn off the ON-OFF switch before lifting pickup arm to arm rest and removing records.

It is normal for early production RC160 changers to cycle if the pickup arm is moved to the arm rest while the turntable is rotating.

When removing records, hold them lightly and lift straight up.

CAUTIONS

1. **Never use force to stop the motor or turntable.**
2. **When turning the record support, be sure to grip the entire record support and cover assembly and not just the plastic record clip.**

ADMIRAL CORPORATION

THE CHANGE CYCLE

5. DESCRIPTION OF CHANGE CYCLE. (See Figures 2, 5, and 6.)

While a record is playing and as the pickup arm moves toward the center of the record, the arm control pin (31A) on the arm control assembly (31) moves along the portion of the arm control track (36B) as indicated at "P", figure 2. As the record reaches the pickup or trip point, the pin reaches point "T" on the track. As it moves into the recessed position in which it it shown in the illustration, it permits the trip spring (35) to pull the arm control plate (36) forward towards the centerpost (27). As the arm control plate is drawn forward, the stop tab (36A) on the arm control plate (36) is withdrawn from behind the stop bracket (43A) on the eccentric cam (43). The cam, which no longer is held in place by the stop tab (36A), is pulled over by the eccentric cam spring (44) until the rubber tire makes contact with the knurled roller (53) on the turntable shaft (28A). This knurled roller, which rotates with the turntable shaft, rotates the eccentric cam. In turn, this forces the riser plate assembly (37) back along its guide rods (51A) away from the centerpost (27). As soon as the riser plate begins to move, the push-off cam and shaft assembly (42) rides along the inclined track (37C) of the riser plate (37). This action causes the push-off cam and shaft assembly (42) to be drawn downward; as a result the pickup arm lift (19) presses down on the arm lift bearing pin (14) causing the pickup arm to be raised clear of the record. Then the riser plate tab (37B) contacts and moves the arm control assembly (31) which, since it is coupled to the pickup arm support assembly (22), carries the pickup arm away from the centerpost and clear of the edge of the turntable. As the riser plate (37) continues to travel further along the guide rods (51A), the riser plate motion bracket (37A) contacts and rotates the push-off cam and shaft assembly (42); as a result, the push-off arm (5), [which is coupled to the push-off cam and shaft assembly (42)] causes the push plate (7C) to drop a record to the turntable.

During the second half of the change cycle, the pressure of the push plate spring starts to return the push plate (7C) and push-off arm (5) back to their normal position. At the same time, the motion of the eccentric cam (43) and the guide rod recoil spring (38) propel the riser plate (37) toward the centerpost. The arm control assembly (31), and hence the pickup arm, are drawn back by the tension in the set-down spring (30). After the arm reaches this point directly above the set-down point, the riser plate (37) has moved far enough back towards the centerpost (27) to allow the push-off cam and shaft assembly (42) to ride down the inclined track (37C) of the riser plate (37). This lowers the pickup arm onto the record. (The following paragraph describes how the set-down point is determined for the 10-inch and 12-inch settings.) As the eccentric cam (43), aided by the eccentric cam spring (44) completes its revolution, the rubber tire of the cam moves away from the knurled roller (53) on the turntable shaft and the stop bracket (43A) comes to rest against the stop tab (36A) of the arm control plate (36). The change cycle is completed.

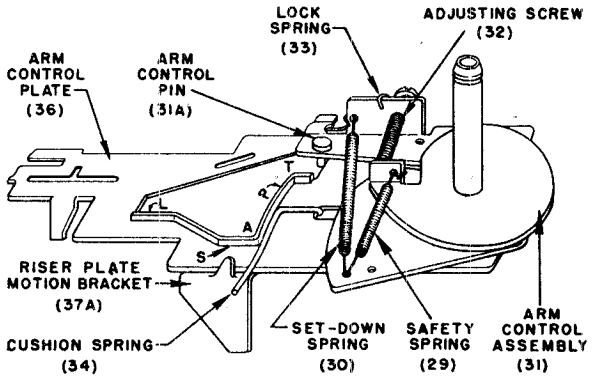

FIGURE 2.

6. DESCRIPTION OF DETERMINATION OF 10-INCH AND 12-INCH SET-DOWN POINTS.

During the early part of the change cycle, the arm control plate (36) has traveled (in a direction away from the centerpost) until the size change stop (36C) reaches the cam (42B) of the push-off cam and shaft assembly. The distance traveled by the arm control plate (36) will depend on the size of the record being played; the distance is less for a 12-inch setting than for a 10-inch setting. (This is true because the push-off cam (42B) presents its short radius to the size change stop (36C) for the 10-inch setting and presents its long radius to the size change stop for a 12-inch setting.) This variation in distance traveled means that the arm control track (36B) will be in a position closer to the centerpost for the 12-inch setting than for the 10-inch setting. This in turn means that during the change cycle the arm control pin (31A) [whose path is determined by the motion of the arm control assembly (31)] will leave its recessed position, and will ride along the "S" portion of the arm control track for the 12-inch setting and along the "L" portion for the 10-inch setting. (See Figure 2.)

As the pickup arm moves back towards the record during the second half of the change cycle, it will be stopped when the bracket (31C) reaches the adjusting screw (32). How far the arm returns before being stopped depends on whether the arm control pin (31A) has been riding in the "S" or "L" portion of the arm control track. If the pin has been riding in the "S" or 12-inch portion of the track, the arm will be stopped at a point directly above the 12-inch set-down point; if the pin has been riding in the "L" or 10-inch portion, the arm will be stopped at a point directly above the 10-inch set-down point.

7. REJECTING A RECORD.

When rejecting a record, the motion of the pickup arm moves the arm control assembly (31) so that the trip spring (35) tension is now permitted to move the arm control plate (36) slightly forward. This movement releases the stop bracket (43A) on the eccentric cam which was engaged by the stop tab (36A) on the arm control plate. The eccentric cam (43) then falls against the knurled roller (53) and the change cycle begins as if a record had just finished playing.

ADMIRAL CORPORATION

ADJUSTMENTS

CAUTIONS

1. **See that the drive pulley (60A), and the rubber tires on both the idler wheel (57) and the eccentric cam (43) are kept clean and free from oil, grease, dirt, or any foreign material. Carbona or carbon tetrachloride may be used for cleaning these parts.**
2. **If replacement of any parts requires the removal of the lift adjusting collar (10), pickup arm support assembly (22) or the push-off arm (5), be sure to re-position or replace these parts as directed in paragraphs 9, 10, and 11 respectively.**

TOOLS REQUIRED

#6 Bristol Set Screw Wrench. (Admiral Part No. P-5805. List Price $0.05.)
#8 Bristol Set Screw Wrench. (Admiral Part No. P-5806. List Price $0.05.)

8. SET-DOWN POINTS AND PICKUP OR TRIP POINT.

(If the pickup arm support assembly (22) has been removed or if its set screws are loose, it must be re-positioned as described in paragraph 10 before adjusting the set-down points and pickup or trip point.)

This changer is designed so that the 10-inch set-down point, the 12-inch set-down point, and the pickup or trip point are simultaneously adjusted in a single operation. It is recommended that you make the adjustment at either of the set-down points. This adjustment is made by means of the adjusting screw (32) shown in figure 1. Turning this screw counter-clockwise will cause the arm to set down closer to the centerpost; turning it clockwise will cause the arm to set down further away from the centerpost. One complete turn on the screw will move the arm about ¼ inch.

If the adjusting screw (32) will not change the setting sufficiently, the pickup arm support assembly (22) may be out of position. (See paragraph 10.)

The set-down points when using a straight-shank needle will differ slightly than when using an offset-shank needle such as the Admiral Lifetime Needle. If you do not know which type of needle is to be used by the customer, we suggest the following settings *when tested with a straight needle:* measuring from the side of the centerpost, 4⅝" for the 10-inch set-down point, 5⅝" for the 12-inch set-down point, and 1-19/32" for the pickup or trip point.

If you know which type of needle will be used by the customer, and test with that type of needle, the following settings are recommended: measuring from the side of the centerpost, 4-21/32" for the 10-inch set-down point, 5-21/32" for the 12-inch set-down point, and 1⅝" for the pickup or trip point.

When using an offset-shank needle, slight variations in set-down point can often be corrected by loosening the needle screw and rotating the needle slightly.

FIGURE 3.

9. PICKUP ARM HEIGHT.

When properly adjusted, the pickup arm height should be such that, without a needle and with a single record on the turntable, the arm should be about 1/32" above the record. The arm height depends on the location of the lift adjusting collar (10). As the collar is moved down, the arm is raised, and vice versa. When necessary, the pickup arm height may be adjusted by re-positioning the lift adjusting collar (10) as follows:

(a) The changer should be out of cycle.
(b) Lift the pickup arm and check to see that the pickup arm lift (19) is positioned properly over arm lift bearing pin (14). (See Fig. 4.)
(c) Remove needle and place pickup arm on turntable close to its edge.
(d) Loosen set screw in lift adjusting collar (10).
(e) Remove slack by pushing up on push-off cam and shaft assembly (42). Do not compress the arm lift shaft spring (41).
(f) Using a #6-32 Bristol wrench, place it in the set screw and slide the lift adjusting collar (10) down until it is snug against the pickup arm lift (19).
(g) Tighten set screw in the lift adjusting collar.
(h) Check height.

If height is still incorrect, it may be necessary to repeat the adjustment. Before doing so, it may be advisable to examine the shaft (42A) of the push-off cam and shaft assembly for nicks and burrs caused by the set-screws. Smooth shaft with file if necessary. The upper portion of the shaft is accessible if the push-off arm (5), head assembly (7) and lift adjusting collar (10) are removed. To prevent shaft from falling out through bottom, keep in place with masking tape. When replacing the lift adjusting collar (10) and push-off arm (5), see paragraphs 9 and 11 respectively.

ADMIRAL CORPORATION

SERVICING AND REPAIR

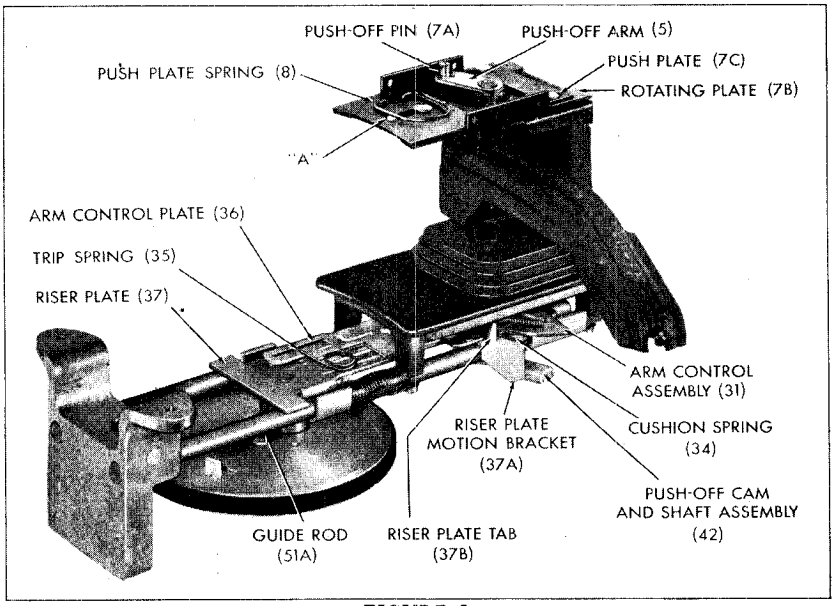

FIGURE 5.

10. RE-POSITIONING PICKUP ARM SUPPORT ASSEMBLY (22).

To assure proper set-down adjustment, this must be done carefully as follows if set screws are loose or if pickup arm support assembly (22) has been removed.

(a) Turn adjusting screw (32) (see paragraph 1) clockwise as far as it will go, then turn back counter-clockwise for 2 full turns.

(b) Place a 12" record on the turntable.

(c) With the changer out of cycle, manually move the arm control assembly (31) outwards as far as it moves freely. In this position, the arm control pin (31A) will be located as indicated at "A" in figure 2.

(d) Place pickup arm so that needle rests in first playing groove on the 12" record.

(e) Tighten the two set screws in pickup arm support assembly (22).

(f) Make the final set-down adjustment as described in paragraph 1.

11. RE-POSITIONING PUSH-OFF ARM (5).

This must be carefully done if set screws are loose or push-off arm (5) has been removed.

(a) Rotate the record support to the 10-inch position. Remove push-off arm (5).

(b) Manually slide the push plate (7C) over the rotating plate (7B) until a piece of metal 3/32 inch in diameter or a #8-32 Bristol wrench can be inserted into the opening at the front of the center slot in the push plate (see "A", figure 5). If the 12-inch push-off is faulty with this setting, try using a 1/16" piece of metal or a #6-32 Bristol wrench.

(c) Put the changer into cycle and manually rotate the turntable until the riser plate (37) has traveled along the guide rods (51A) to a position furthest away from the turntable.

(d) Now position push-off cam and shaft assembly (42) so that it is held tightly against riser plate motion bracket (37A).

(e) Put push-off arm in position, leaving about 1/16" clearance between the top of the push plate and the push-off arm.

(f) Tighten set screws in push-off arm.

12. CHANGER REPEATEDLY GOES THROUGH CHANGE CYCLE WITHOUT PLAYING RECORD.

(a) Mounting screw on eccentric cam (43) may be loose. Tighten.

(b) Cushion spring (34) has slipped out of position and is on wrong side of riser plate tab (37B). Re-position spring. (See figure 5.)

(c) In normal operation, the trip spring (35) holds the arm control plate (36) against the riser plate (37). If the trip spring is faulty, it permits the arm control plate to rise too high above the riser plate. This causes the stop bracket (43A) to pass underneath the stop tab (36A). To correct, bend the legs of the trip spring closer together. If necessary, replace trip spring.

(d) Eccentric cam (43) is bent so that stop bracket (43A) passes underneath stop tab (36A) on the arm control plate (36). To correct, straighten cam by putting changer out of cycle and pressing upward on cam near stop bracket.

(e) The stop bracket (43A) on the eccentric cam (43) is not properly bent and is failing to engage stop tap (36A) on arm control plate (36). To correct, bend stop bracket (43A) until it is at right angles to disc of eccentric cam.

13. NEEDLE SLIDES ACROSS PORTION OF RECORD AFTER SET-DOWN ON 12-INCH RECORD.

Cushion spring (34) has slipped out of position and is on wrong side of riser plate tab (37B). Re-position spring. (See figure 5.)

14. CHANGER CYCLES WHEN PICKUP ARM IS MOVED TO ARM REST.

It is normal for early production RC160 changers to cycle if the pickup arm is moved to the arm rest while the turntable is rotating. Turn off the ON-OFF switch before lifting pickup arm to arm rest.

SERVICE PARTS LIST

RC160 RECORD CHANGER

See Exploded View, Figure 6, for Identification of Parts.

Ref. No.	Part Number	Description
1	G400A109	Cover assembly (Includes 3 and 4)
2	13A1-3-57	Snap buttons (cover)
3	405A4	Spring, record clip
4	414A4	Spring rod (record clip)
5	G400A66	Push-off arm assembly (When replacing, refer to paragraph 11)
6	1A44-38	Set screw (Bristol Head #6-32x3/16")
7	G400B68	Head assembly (Includes 7A, 7B, 7C, 7D, 8 and 9)
7A		Push plate pin (Part of 7)
7B		Rotating plate (Part of 7)
7C		Push plate (Part of 7)
7D		Head mounting plate (Part of 7)
8	405A38	Spring, push plate (Located on top of push plate)
9	405B18	Spring, head mounting plate (Located on bottom of head mounting plate assembly)
10	402A57	Lift adjusting collar (When replacing, refer to paragraph 9)
11	G400A91	Pickup arm, pivot spring and arm lift bearing pin assembly (Does not include 15 and 16)
12		Rivet (pickup arm pivot spring) } Supplied as a group only; order part number 98A1
13		Pivot spring (pickup arm) } Supplied as a group only; order part number 98A1
14		Arm lift bearing pin } Supplied as a group only; order part number 98A1
15	405A13	Spring clip (pickup arm)
16	409A3	Pickup cartridge } Interchangeable
	409A2	Pickup cartridge } Interchangeable
	409A1	Pickup cartridge } Interchangeable
17	42-250-C2-47	Screw (Fil.H.M.S. #4-40x1/4"; for mtg. cartridge)
18	402A43	Needle screw for cartridge
19	G400A86	Pickup arm lift assembly
20	405A46	Brake spring (5 turns)
21	405A37	Retaining ring (Used on arm support tube 31B)
22	G400A73	Pickup arm support assembly (When replacing, refer to paragraph 10)
23	405A27	Washer, spring
24	65-312-C2-47	Screw (B.H.M.S. #6-32x5/16"; for mtg. assembly 7)
25	G400B80	Base (die cast)
26	G400A46-1	Arm rest
27	G400A12	Centerpost
28	G400B49	Turntable
28A		Turntable shaft (Part of 30)
29	405A41	Safety spring
30	405A42	Set-down spring
31	G400A84	Arm control assembly
31A		Arm control pin (Part of 31)
31B		Arm support tube (Part of 31)
31C		Bracket (Part of 31)
32	60-875-C2-21	Adjusting screw
33	405A44	Lock spring (set-down adjustment)
34	405A45	Cushion spring
35	405A43	Trip spring
36	G400A112	Arm control plate
36A		Stop tab (Part of 36)
36B		Track (Part of 36)
36C		Size change stop (Part of 36)
37	G400A88	Riser plate assembly
37A		Riser plate motion bracket (Part of 37)
37B		Riser plate tab (Part of 37)
37C		Inclined track (Part of 37)
38	405A9	Spring, recoil
39		Retaining ring (arm lift shaft) } Furnished as an assembly only; order part number G400A98
40		Safety collar (arm lift shaft) } Furnished as an assembly only; order part number G400A98
41		Spring (arm lift shaft) } Furnished as an assembly only; order part number G400A98
42		Push-off cam and shaft assembly } Furnished as an assembly only; order part number G400A98
42A		Arm lift shaft (Part of 42)
42B		Push-off cam (Part of 42)
43	G400A78	Eccentric cam and tire assembly
43A		Stop bracket (Part of 43)
44	405A47	Spring, eccentric cam
45	4B1-57-47	Flat washer (eccentric cam)
46	84-250-C2-21	Screw (R.H.M. #8-32x1/4"; for mtg. eccentric cam)
47	406A1	Rubber tire, eccentric cam
48	412A1	Cork washer (3/32" thick)
49	415A2	Thrust bearing assembly (Replace as a unit)
50	412A9	Cork washer (3/64" thick)
51	G400B56	Turntable mounting and guide rod assembly
51A		Guide rods (Part of 51)
52	62-500-C2-21	Screw (Fil.H.M.S. #6-32x1/4"; for mtg. guide rod)
53	402A5	Knurled roller, turntable shaft
54	1A44-13	Set screw (Bristol #8-32x1/8"; for knurled roller)
55	3A2-S-47	Lockwasher, split (1/4" diameter)
56	402A41	Hex nut (1/4"-20; used on centerpost)
57	G400A23	Idler wheel assembly (Used with motor 407B3 only)
	G400A57	Idler wheel assembly (Used with motor 407B1 only)
	G400A59	Idler wheel assembly (Used with motor 407B2 only)
58	405A15	Spring, hairpin
59	405A14	Spring, idler wheel (Used with motor 407B3 only)
	405A35	Spring, idler wheel (Used with motor 407B1 only)
	405A36	Spring, idler wheel (Used with motor 407B2 only)
60	407B3	Motor, complete with idler wheel; 105-125 volts, 60 cycle (Motors 407B1 and 407B2 are interchangeable with 407B3)
60A	401A48	Drive pulley (Part of 73. For motor 407B3 only.)
61	4B1-36-47	Flat washer
62	406A4	Rubber grommet (motor mounting; for motor 407B3)
	406A9	Rubber grommet (motor mounting; for motor 407B1)
*	406A10	Rubber grommet (motor mounting; for motor 407B2)
63	401A53	Spacer, grommet (Used with motor 407B3)
	402A44	Spacer, grommet (Used with motor 407B1)
	402A45	Spacer, grommet (Used with motor 407B2)
64	60-875-C2-2	Screw (R.H.M.S. #6-32x7/8"; used for mounting motor on metal base)
	60-1125-C2-21	Screw (R.H.M.S. #6-32x1 1/8"; used for mounting motor on wood or plastic base)
65	406A5	Rubber grommet (Large; used with metal base)
	406A2	Rubber grommet (Used with wood or plastic base)
66	402A36	Spacer, mounting (Used with metal base)
	29A2-4-21	Spacer, mounting (Used with wood or plastic base)
67	80-1000-C2-47	Screw (R.H.M.S. #8-32x1"; used for mounting record changer on metal base)
	280-875-C2-2	Screw (R.M.H.S. Sems #8-32x7/8"; used for mounting record changer on wood or plastic base)
68	406A6	Rubber grommet (Small; used with metal base)
	406A2	Rubber grommet (Used with wood or plastic base)
69	29A2-6-21	Spacer, mounting (Used with wood or plastic base)
70	60-250-C2-47	Screw (R.H.M.S. #6-32x1/4"; used for mounting record changer on metal base)
	260-687-C2-2	Screw (R.H.M.S. Sems #6-32x11/16"; used for mounting record changer on wood or plastic base)
71	89A5-9	Shielded output cable and plug (Used on models 5RP47, 6RC45 and 6RC46 only)
72	88A2-1	Plug (output)
73	77A1-15	Switch, On-Off (Used on model 5RP47 only)
74	12A3-4	Rubber bumper (Used on model 5RP47 only)
	405A30	50 cycle conversion spring (For motor 407B1)
	405A31	50 cycle conversion spring (For motor 407B2)
	405A32	50 cycle conversion spring (For motor 407B3)

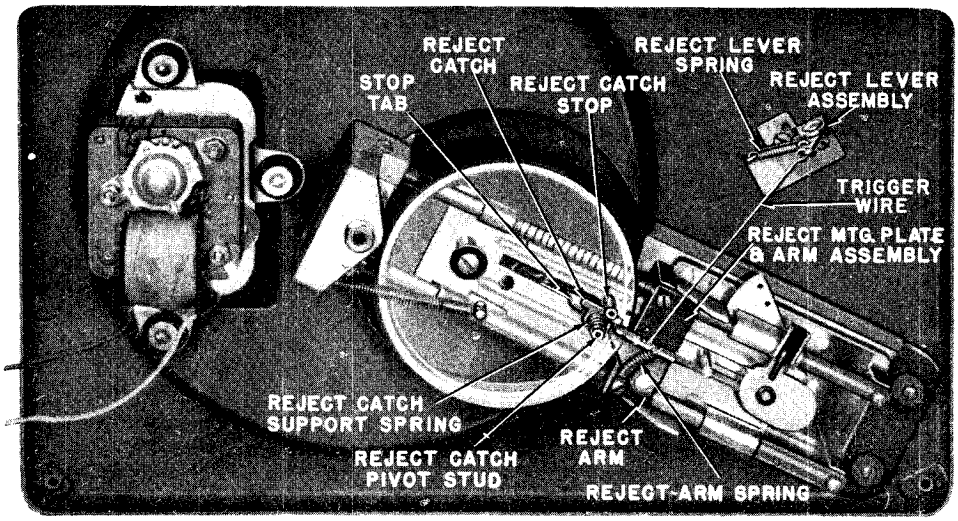
ADMIRAL CORPORATION

RC160A RECORD CHANGER

When servicing the RC160A, use this supplement with the RC160 Service Manual

IMPORTANT

The RC160A Record Changer is similar in appearance to other Admiral changers. To be certain which model changer you are servicing, look for the changer model number which appears on the small label attached to the underside of the changer mechanism.



ECCENTRIC CAM IN PHANTOM TO SHOW REJECT CATCH

The RC160A is a modification of the RC160 Record Changer. Hence, the Service Manual for the RC160 Record Changer may be used for servicing the RC160A if the following changes are noted:

THE REJECT MECHANISM

A push-button reject mechanism has been provided in the RC160A Record Changer.

The reject button is located on the top of the arm rest. The additional parts used to provide push-button rejection are shown in the illustration above; part numbers are listed below under "Service Parts List".

The illustration above shows the changer out of cycle, that is, when a record is playing. Note that the reject catch engages both the stop tab on the arm control plate, and the reject arm. If the changer is allowed to finish playing the record, the stop tab on the arm control plate is withdrawn from behind the reject catch; the eccentric cam is then pulled against the knurled roller and the change cycle begins. However, when the reject button is pressed, the reject trigger wire pulls the reject arm from behind the catch; the eccentric cam is pulled against the knurled roller and the change cycle begins.

TURNTABLE MOUNTING

The RC160A also features an improved turntable shaft bearing arrangement. Self-lubricating porous bronze bearings are now pressed into the turntable mount casting. This feature was also added to the later RC160 changers.

OPERATING INSTRUCTIONS

To start the RC160A Record Changer, load the record changer, set the record clip, and turn on the On-Off switch. Now press down on the reject button directly or push down on the pickup arm momentarily if it is setting on the arm rest. The entire stack of records will be played automatically.

To reject a record, merely press down on the reject button.

SERVICE PARTS LIST

(All parts not listed below are the same as in the RC160 and should be ordered from RC160 Service Manual)

Part Number	Description
G400A115	Reject lever assembly
405A25	Spring, reject lever
414A12	Reject trigger wire
G400A116	Reject mounting plate and arm assembly
	Reject arm (part of reject mtg. plate and arm assembly)
405A25	Reject arm spring
401A97	Reject catch
405A15	Hairpin spring (reject catch)
405A50	Reject catch support spring

Part Number	Description
G400A117	*Eccentric cam and tire assembly (Does not include reject catch support spring or hairpin spring)
	Reject catch pivot stud (part of cam)
	Reject catch stop (part of cam)
G400A111	*Turntable mounting and guide rod assembly
402A62	*Knurled roller
G400A46-1	Arm rest assembly (Mounted on metal only)
G400A46-2	*Arm rest assembly (Mounted on wood or plastic)

*These parts are not interchangeable with RC160 parts having same description but different part numbers.

CONCORD RADIO CORP.

Illustration 1

OPERATING INSTRUCTIONS

This changer is a simple, gearless, foolproof mechanism (See Illustration 3), designed to give the maximum convenience and pleasure with a minimum of attention and care. For the fullest enjoyment of your recordings and carefree operation of your changer, the following instructions should be observed.

This machine operates on 115 volt, 60 cycle alternating current only.

FOR AUTOMATIC OPERATION

This machine will play and automatically change a series of up to twelve 10-inch records or ten 12-inch records of the 78 r.p.m. type having an eccentric stopping groove. Recordings sold today for home use are of this type. Very old records that do not have an eccentric stopping groove can be played semi-automatically by operating the reject lever at the conclusion of each selection.

1. Raise the tone arm, loosen the needle thumb screw and insert the needle with the flat on the needle shaft toward the screw; tighten the screw. Sapphire point needles are recommended, but any long-wearing alloy-tip needle will give satisfactory performance. Ordinary steel needles are not advisable as they do not play more than a few records per needle. (See Illustration 2.)

2. On the tone arm hub are two detents (grooves) marked A and H. By holding the hub and moving the tone arm sidewise, these detents can be positively felt. Engage the detent marked A for automatic operation. (See Illustration 2.)

3. The record support shelf must be adjusted for 10-inch or 12-inch records. By firmly grasping the shelf and rotating it one-half revolution in either direction, positive detents can be felt. For 10-inch records the wider ledge should face the spindle. For 12-inch records rotate the shelf so that the narrower ledge is toward the spindle. (See Illustration 2.)

4. The toggle plate, which hinges between the 10-inch and 12-inch positions on the record shelf, should be flipped toward the back, away from the spindle. (See Illustration 2.)

5. Place the load of records on the changer; they should be supported at the center on the spindle, and at one side on the record shelf. (See Illustration 1.)

6. Flip the toggle plate over on to the top of the record stack. This must be done to provide the necessary tension to allow records to drop correctly. (See Illustration 1.)

7. Push the control lever to the "ON" position. If the changing action does not start at once, push the lever to the reject position and release. The changer will now automatically play the load of records.

If you should forget to turn the machine off after the last record has played, no harm will come to the mechanism, as the last record will continue to play until turned off.

TO REMOVE RECORDS

1. Move the control lever to the "OFF" position while the needle is still on the record. If the tone arm is lifting off the record, wait a moment until it moves back down onto the record before turning off the machine.

2. Lift the tone arm from the records and place on the tone arm rest.

3. Flip the toggle plate toward the back, away from the spindle.

4. Lift the records off the turntable until they completely clear the spindle.

©John F. Rider

©John F. Rider

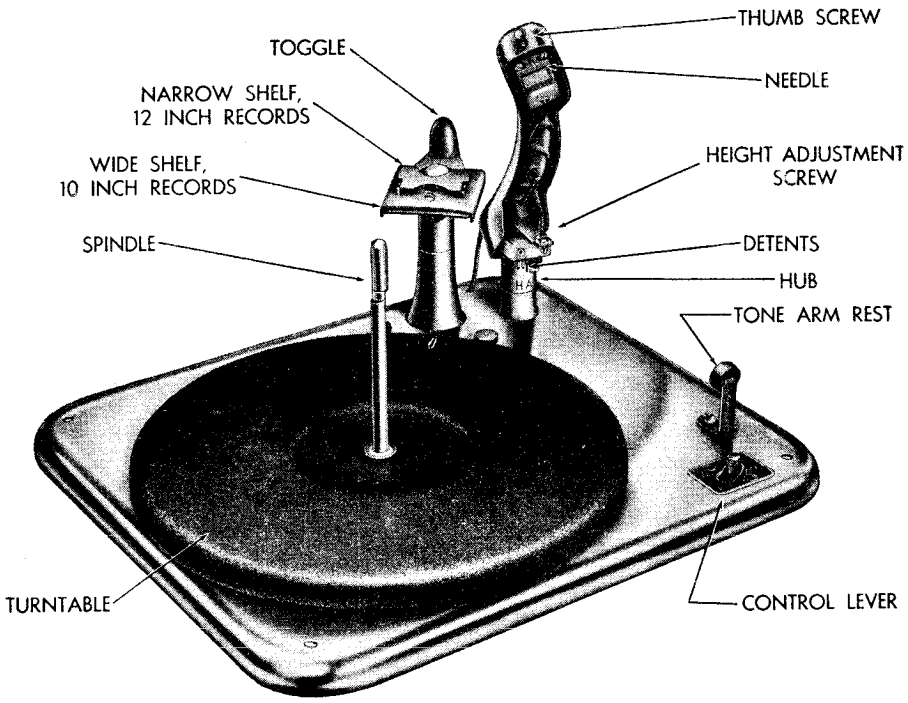

Illustration 2

The spindle used on this record changer is completely automatic. When removing the records from the turntable, the pressure of the records under the top section of the spindle causes it to rotate, automatically, into the correct position for removal of the records. As soon as the records are free of the spindle, the top section drops back into the correct position for reloading.

TO REJECT RECORDS

A record may be rejected at any time during playing by simply pushing the control lever momentarily to the reject position.

NON-STANDARD RECORDS

This machine has been designed to give excellent performance as a completely automatic record changer. Records, such as home recordings, children's records, etc., which are not intended for automatic playing, may be played manually. For satisfactory operation, carefully observe the following instructions:

1. Move the tone arm into "H" detent on the hub.
2. Rotate the record shelf to the 12-inch position.
3. Flip the toggle plate toward the back.
4. Put the selected record over the spindle and down onto the turntable.
5. Move the control lever to the "ON" position.
6. Wait a moment until the tone arm raises and completely lowers; the tone arm will then be free to be placed by hand on the starting edge of any size record on the turntable.
7. At the conclusion of the record, move the control lever to the "OFF" position and place the tone arm on the rest.

SPECIAL INSTRUCTIONS

Do not oil any part of the changer as it has been permanently lubricated at the factory.

Changer should be level as any tilt would cause the tone arm to fall in the direction of the tilt.

To adjust the height of the tone arm from the record: (If needle does not set down on record, or if it does not raise high enough to clear the top of the last record of a stack) Raise the tone arm and turn the height adjustment screw counterclockwise to increase the height of the tone arm, or turn clockwise to lower the tone arm. (Loosen the nut to adjust the screw; tighten again after resetting the screw.)

Do not attempt to make any other adjustment as mechanism has been adjusted at the factory.

FARNSWORTH TELEV. & RADIO CORP.

Due to the fact that a thorough understanding of the proper operation of a record changer is necessary before any attempt be made to repair or effect service adjustments, a description of the change cycle of the P-51 Record Changer is given.

The Record Shelf is set for the size record to be played by turning the Shelf to the position having the shortest distance from the Spindle for 10 inch records and to the position having the greatest distance from the Spindle for 12 inch records. Then the correct number of records should be placed on the shelf. (Twelve 10" or ten 12" but not mixed). Do not turn the Record Shelf until the changer has stopped automatically after all the records are dropped or removed from the Record Shelves.

Badly chipped records or records with breaks should not be used.

The Two makes of motors used on the P-51 Automatic Record Changers are the Alliance Motor and the General Industries Motor. The complete motors are interchangeable, but it is necessary to identify the make of motor when ordering an Idler Pulley. Either make may readily be distinguished by noting the location of the fan on the motor and the location of the hair pin cotter holding the Idler pulley as shown in above figure 3.

DO NOT LUBRICATE THE FOLLOWING PARTS:

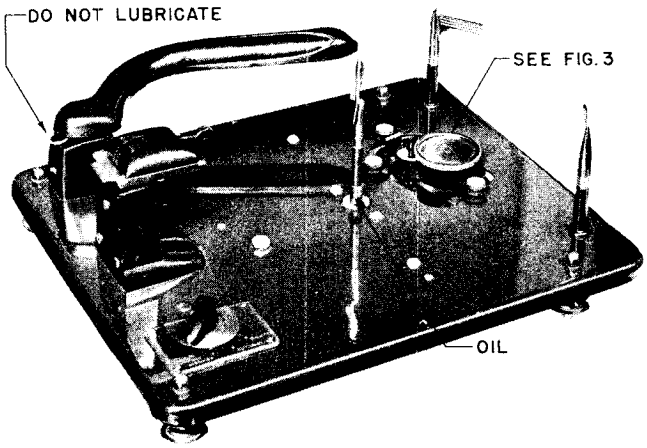
Friction Trip Assembly
Tone Arm Support Tube No. 15123
Starting Lever Assembly No. 07329
Tone Arm Hinge Pin No. 561337

LUBRICATION POINTS

(FIGURE 11)

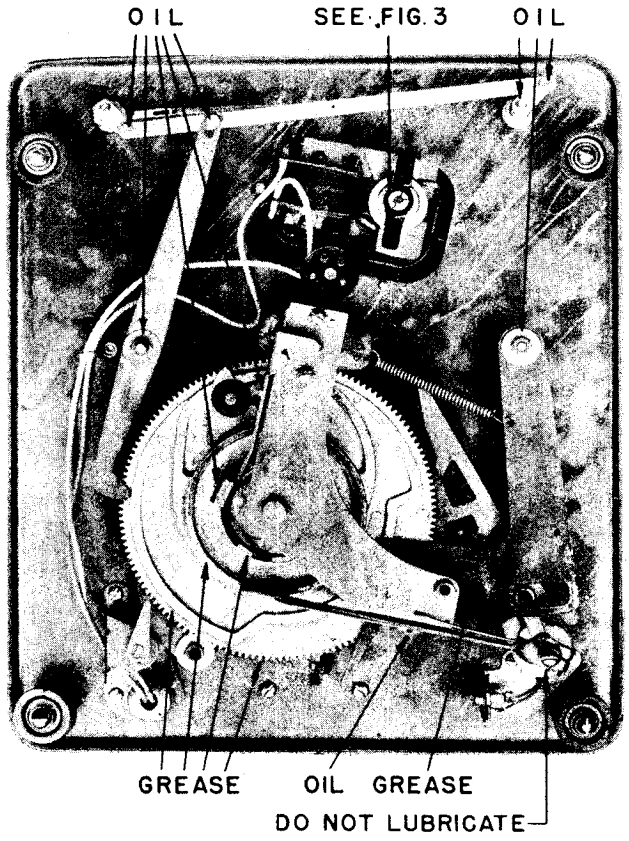
USE LIGHT MACHINE OIL ON FOLLOWING PARTS:

Turntable Drive Shaft Felts No. 92189
Tone Arm Lift Lever Rivet
Record Lift Lever Rivet and Roller Pin
Tone Arm Return Lever No. 561354 at the Spacer No. 561350
Phono Motor (one drop on felt at each end of shaft)
Idler Pulley (see fig. 3 page 3)
Crank Link Lever at Pivot Point
12" Interceptor Shaft at bearing in baseplate



USE LIGHT GREASE OF VASELINE TYPE AT FOLLOWING POINTS:

Very light film at Spindle and tube bearing surface
Main Cam Tube or Stud
Main Cam at Gear Teeth and Cam Track
Tone Arm Return Lever at Guide Spacer
At Record Lift Lever and Spindle Ball



LUBRICATION

The record changer should be lubricated and cleaned periodically or when a major part or assembly is replaced. Dirt, old oil or grease may be removed with carbon tetrachloride or other similar cleaning fluid.

Use only a good grade of machine oil with a viscosity of SAE 10.

Care should be exercised to prevent an excess of oil being used on any part and that no oil gets on the motor pulley, idler pulley or turntable rim.

Every six months or once a year a thin coat of light grease of the vaseline type may be applied to all surfaces of the main cam that contact lift levers and tone arm lift lever.

MODEL P-51

FARNSWORTH TELEV. & RADIO CORP.

CYCLE OF OPERATION

Turn on the control which starts the phonograph and move the Control Knob to reject position and hold until the Tone Arm begins to move toward the Turntable, then release the knob. The changer will go into cycle. The Tone Arm should swing clear of the stack, a record should drop to the Record Ejector Plunger, pause, then gently settle to the Turntable. The Tone Arm should swing over the record and be lowered to the starting groove on the record. When the record is played the above cycle is repeated until there are no records remaining on the Record Shelf. After the last selection has been played the changer will automatically stop.

The above cycle of operation for the P-51 Changer is explained in the following description and illustrations.

When the Control Knob is moved to reject position, the Reject Lever pulls the Starting Lever against the Starting Pawl on the Spindle Gear and Pawl Assembly, which makes the Main Cam mesh with the Spindle Gear.

Figure A. The Turntable is screwed onto the Spindle Gear and both are driven through the Idler Pulley by the motor. When the cycle is completed the Main Cam disengages from the Spindle Gear because several teeth are left off the Main Cam Gear . This is called the playing position.

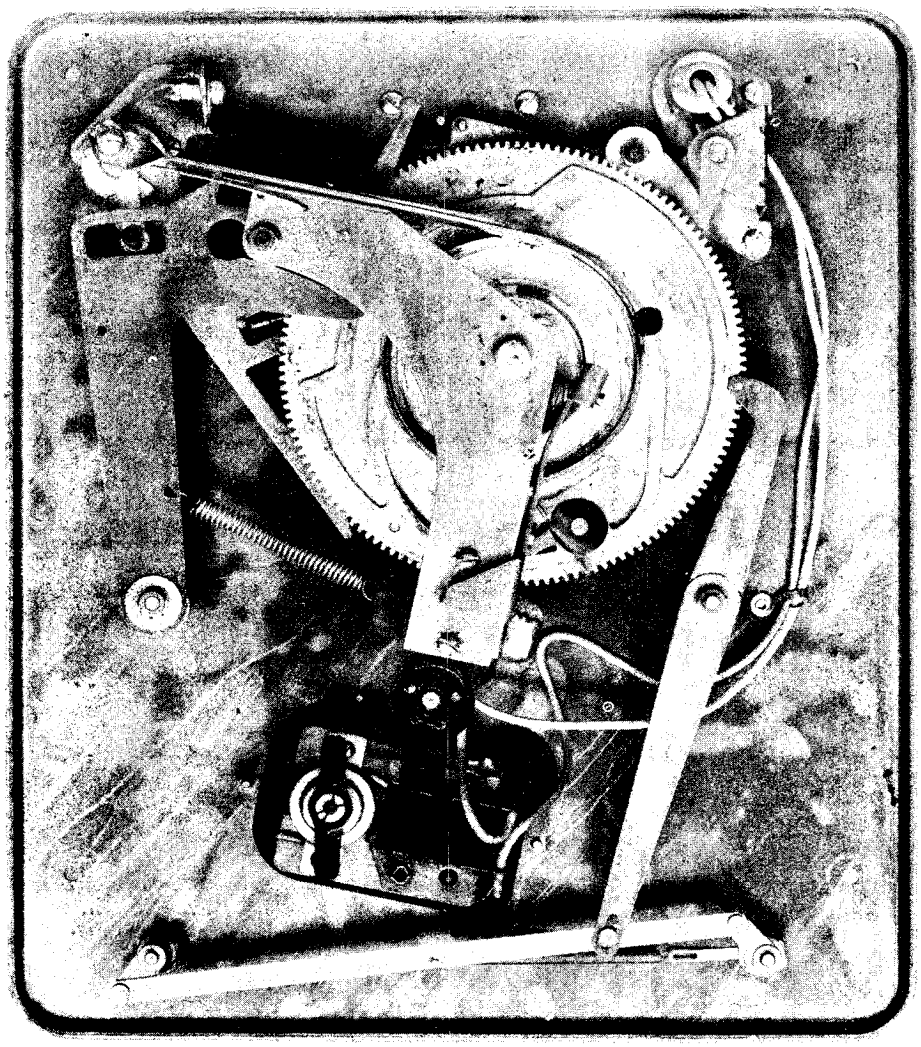

FIGURE A

©John F. Rider

FARNSWORTH TELEV. & RADIO CORP.

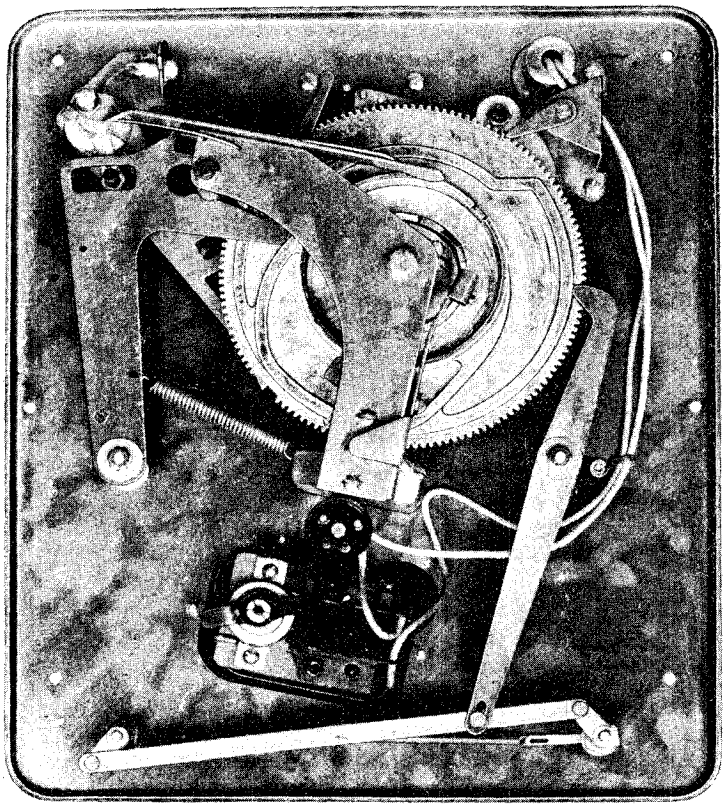

FIGURE B

Figure B. The change cycle has just started. The Tone Arm Lift Lever has raised the Tone Arm from the record and the Tone Arm Return Lever has started to move the Tone Arm away from the Turntable. The Record Lift Lever Assembly has started to raise the Spindle and stack of records resting on it.

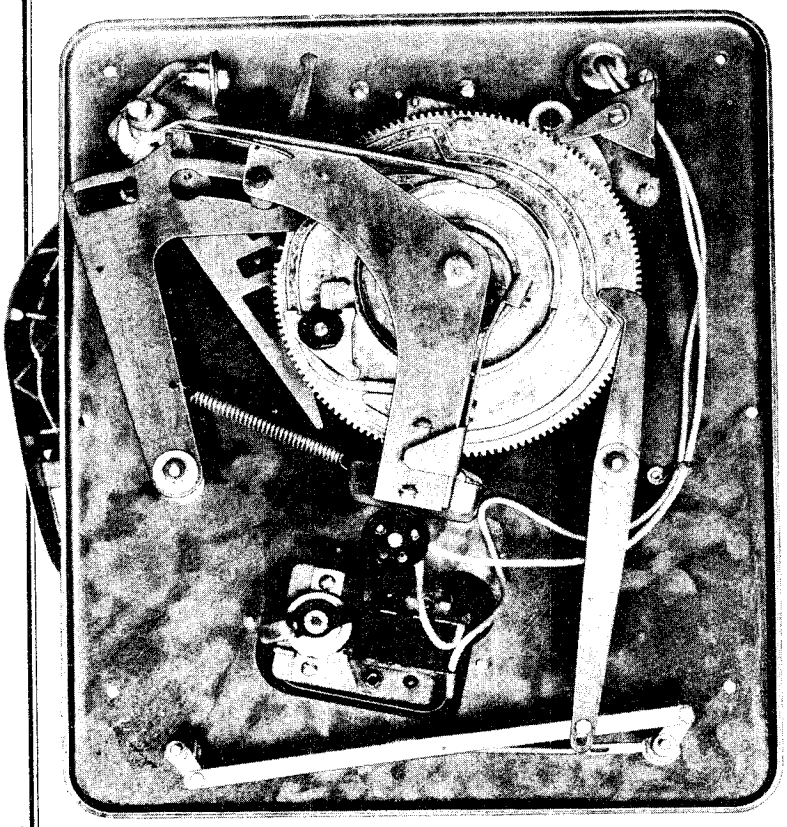

FIGURE C

Figure C. The Shelf Lever has moved in toward the center of the Main Cam which moves the Support Shelves in under the record stack. At the same time the Record Lift Lever has started to lower the Spindle and the stack of records.

1. TO REMOVE TURNTABLE 13435.

See figure 1.

The Spindle Gear may be wedged by a wooden block or a wrapped screw driver between it and the Main Cam, to prevent it from turning while the Turntable is being unscrewed from the Spindle, (by rotating counter-clockwise). When replacing Turntable, see that the "C" Washer (No. 561403) remains fully inserted in the Turntable shaft and make sure the Turntable does not bind on the Idler Pulley. The Turntable may then be properly tightened. The Record Latch must be entirely in the recess in the Spindle to permit the Turntable to be replaced. NEVER USE GAS PLIERS TO HOLD SPINDLE.

2. TO REMOVE IDLER PULLEY.

See figure 3.

After the Turntable has been removed, the Idler Pulley can be removed by slipping off the small hairpin cotter on the end of the Idler Pulley shaft.

When replacing the Pulley a single drop of oil should be used on the pulley shaft.

CAUTION: Do not allow oil to get on either the Idler Pulley or the Turntable Rim.

3. FRICTION TRIP ASSEMBLY

See Figure 5.

The Trip Finger Spacer, part No. 56137, is set on the Tone Arm Support Tube (15123) with an allowance of eight thousandths of an inch clearance between the Cork Washer (50204) and the Baseplate. No attempt should be made to adjust the Friction Tip by changing this clearance. The Friction Trip is adjusted by raising or lowering the Tone Arm Crank (54108) on the Tone Arm Support Tube, after loosening Tone Arm Crank set screw.

4. STARTING TRIP ASSEMBLY

The Starting Lever (07329) is a part of the Main Cam Assembly (See fig. 4). This Lever is changed from trip position to play position by striking washer No. 37179 (see fig. 5) during the change cycle. If the washer does not move the Starting Lever far enough, the changer will trip again as soon as the change cycle is completed. To correct adjustment, loosen Lock Nut 2015-007 and move Washer 37179 in toward the Main Cam. Tighten Lock Nut securely after proper adjustment has been made.

5. TONE ARM DROP AND NEEDLE LANDING

The Needle should drop on the record at a position equi-distance from the outer edge and the first playing groove of a standard record. Make sure the changer is in playing position; that is, the Tone Arm has moved over so the Needle is on the record. To make adjustment for 10-inch records, loosen the Tone Arm Crank set screw and move the Tone Arm Crank (54108) clockwise to move the needle out. When making this adjustment, be careful not to disturb Friction Trip adjustment. After the 10-inch setting has been properly made and the set screw tightened, the 12-inch landing will usually be correct. If not it will be necessary to slightly bend the Tone Arm Return Lever (561354) near the point where it touches the 12-inch interceptor Shaft (561317), see fig. 10. In both adjustments, the Record Shelf must be in the corresponding 10-inch or 12-inch position.

6. TONE ARM HEIGHT See Fig. 10

The Tone Arm height during change cycle is adjusted by raising or lowering screw (2000-313) on the Tone Arm Lift Lever. With records on the Shelf and Spindle, the top of the Tone Arm at the highest point during change cycle should be 3/16" below the bottom of the lowest record of the record stack.

7. RECORD LATCH CHATTER

Any chatter developing in the Record Latch (56130) Figure 4, may be corrected by applying a drop of light oil between the moving part of the Turntable Drive Shaft (561368 and the stationary spindle, (15120).

8. When repairs are being made a careful check should be made of all moving parts in order to make sure that no binding occurs. Check all moving parts for binding before springs are connected.

All levers which operate on shoulder studs should be assembled with the burred side of the retaining washer away from the lever. This method is necesary to prevent the washer from binding on the lever.

9. CHECKING CHANGER IN CABINET

Before checking any P-51 record changer in the cabinet, make sure the mounting bolts are released and the cardboard spacers are removed; otherwise the changer will not properly feed records from the record support shelf and the tone arm will not position properly on the record. If any adjustments are made with the changer bolted down and the mounting bolts then released these adjustments will have to be remade.

When setting up a P-51 changer it should be checked for a needle landing with a full stack of records, both 10-inch and 12-inch. This is done by loading the record support shelf with 12 ten-inch records and moving the control knob to reject, allow the record to play through and trip, check the landing on the second record, then trip records up to and including eleven. Allow the eleventh record to play through and feed number twelve automatically, observe needle landing and automatic trip. Repeat above using ten 12-inch records, only instead of records eleven and twelve, substitute records nine and ten in the preceding section.

10. CAUTION: The use of force in an effort to raise the Tone Arm to a greater height than permitted by the Tone Arm Support may result in breaking of the Tone Arm.

11. REPLACING THRUST BEARING

When replacing Thrust Bearing 56959, see fig. 4, the thrust bearing washer having the smaller hole must be placed in the turntable drive shaft bracket 57160 first, that the shoulder on the turntable drive shaft may rest on the washer.

12. REPLACING INDEXING SPRING

Move control knob to Automatic position and pull off knob. Remove the two screws holding switch assembly to baseplate. Push the reject rod from hole and remove switch assembly. Remove the hairpin cotter from shaft and pull shaft forward so that pawl will not interfere with spring. Replace spring. Hold the spring against bracket away from pawl and push shaft into place. Be sure the lip on the pawl enters the slot in the switch. Replace hairpin cotter and assembly is ready to be replaced.

50 CYCLE CONVERSION

The Service Department will, upon request furnish information pertaining to the conversion of 60 cycle operated changers to 50 cycle operation.

MODEL B-24RC

GALVIN MFG. CORP.

All service adjustments on Motorola Record Changers should be made with the instrument in a normal operating position.

Therefore, the instrument should be supported in such a manner that parts underneath are accessible. A jig consisting of four corner support posts would be helpful. A mirror would also permit the service man to make observations and adjustments without getting into awkward positions.

CHECK THE RECORD FIRST

Before attempting to service or adjust the record changer check the records first to make sure they are not causing the trouble. This instrument will handle most of the 10 or 12 inch records available on the market, but it is not guaranteed to handle all of them. Records must be in good mechanical condition and should not be chipped, particularly around the center hole. Do not try to play automatically records that are too thick, too thin, or that are oversized or undersized, in regard to the diameter of record or center hole. Do not mix 10 and 12 inch records on the changer.

Warped records can slip on the turntable and introduce 'WOWS'. Such records may be flattened by placing between two pieces of flat plate glass and then heating in the sun or oven. Do not overheat. Allow record to cool for several hours before removing glass.

Old records made before the days of automatic record changers may not change automatically, due to the difference in thickness, or to lack of the proper eccentric groove at the finish. Most of the old records, however, may be played one at a time.

RECORD CHANGER OPERATION

SUMMARY OF OPERATION INSTRUCTIONS

As many as 10 ten-inch or 8 twelve-inch records may be loaded and played automatically on this record changer at one time.

Set the record support for the size records to be used and place records on spindle. Records will be supported above turntable by the small ledge formed by the off-set in the spindle and the record support. Steady the stack with the record hold down plate.

The left hand button will start the motor. Momentarily push the right hand button to the reject position to start the cycle. Last record will be repeated until the machine is stopped. When playing records automatically, never touch the pick-up arm when the instrument is in a changing cycle. Lift up the pick-up arm only while it is resting on the record.

To play records manually, push right hand button to MANUAL position and load records one at a time. When loading, hold the record at a slight angle so that the edge is under the lip of the record support. The record support should be turned to the 12" position to allow more room for loading and unloading records.

THEORY OF OPERATION

By referring to the various photographs and figures which will be found in the service manual, you can readily follow through the changing cycle from the continuity given hereafter:

The turntable is rim driven. Power is transmitted to it from the motor shaft by means of a rubber tired drive wheel. The record spindle does not revolve; it is fixed to the record changer base.

The heart of the record changer is the main cam wheel. On it are cast all the cams, extrusions etc., required to perform all the operations during the changing cycle. See Figure 2.

©John F. Rider

GALVIN MFG. CORP.

The only mechanism that operates during the playing of a record is the motor and turntable. The changing mechanism is entirely disengaged until the change cycle starts.

In explaining the theory of operation, let us begin from the point where the record changer is just finishing a record.

The needle in the pick-up finishes the record and enters the eccentric groove. This imparts an oscillating motion to the pick-up arm, which in turn causes the trip pawl to release the trigger through its action against the ratchet arm. See Figures 3A & B. If the record does not have an eccentric groove, the limit stop will trip the trigger when the pick-up needle reaches a point 1-7/8" of the spindle center. See Figure 3C.

Tripping the trigger, releases the bell crank assembly, allowing its tension spring to push the cycle drive pulley up against the inside rim of the revolving turntable, starting the changing cycle. See Figures 3B & C. With the same motion of the bell crank, its roller leaves the detent notch in the rim of the main cam wheel and the main cam wheel revolves. The roller now rides on the rim of the main cam wheel and in this manner holdsthe cycle drive pulley firmly against the turntable.

As the main cam wheel revolves, the pick-up rod rides out of the inclined section, raising the pick-up clear of the record. See Figure 4. After the pick-up arm is elevated, continued rotation of the main cam wheel swings the pick-up arm outward, clear off the record. The lateral movement of the pick-up arm is controlled by the selector stud which rides in a specially shaped groove in the main cam wheel. See Figure 4.

At the same time the pick-up arm was being lifted and swung clear, the record release cam was rotated through 180° by the gear segment arm to pick up a record and then back to its normal position in line with the record post, to drop the record on the turntable. The movement of the segment gear is controlled by the specially shaped groove on the bottom of the main cam wheel. See Figure 5.

Continued rotation of the main cam wheel swings the pick-up arm (by the action of the selector stud riding in the top groove of the main cam wheel) back over the first groove in the record and the arm is gently lowered onto the record when the inclined section of the main cam wheel reaches the pick-up rod. See Figure 4.

As the main cam wheel approaches the full 360 degree point of its rotation, the trigger reset extrustion pushes against the trigger reset stud of the small trip arm, causing the trigger to be "cocked" ready for the next cycle, and in the same motion applies spring tension through the torsion spring to the bell crank lever so that when the main cam wheel detent notch reaches the bell crank lever roller, the roller falls into it, pulling the cycle drive pulley away from the turntable, causing the main cam wheel to stop, thus ending the cycle. See Figure 6.

A shorting switch, operated by the straight and inclined sections of the main cam wheel, shorts the pick-up cartridge whenever the record changer is in cycle. This keeps all unwanted noises from reaching the speaker.

Turning the record support post, to accommodate the size record being used, automatically sets the mechanism so the pick-up needle will come down in the middle of the blank area between the outer edge and the first groove of the record. Turning the record post, positions the large trip arm so that the attached pick-up arm will swing out farther for 12 inch records and closer in for 10 inch records. See Figure 4.

The right hand button controls a three position mechanical switch. Through it, it is possible to start the changing cycle at any time regardless of whether or not the record has been completely played. By this means a record can be rejected. This lever can also be pushed into the manual position at any time without damage to the mechanism. Figure 7 shows the mechanics behind the switch.

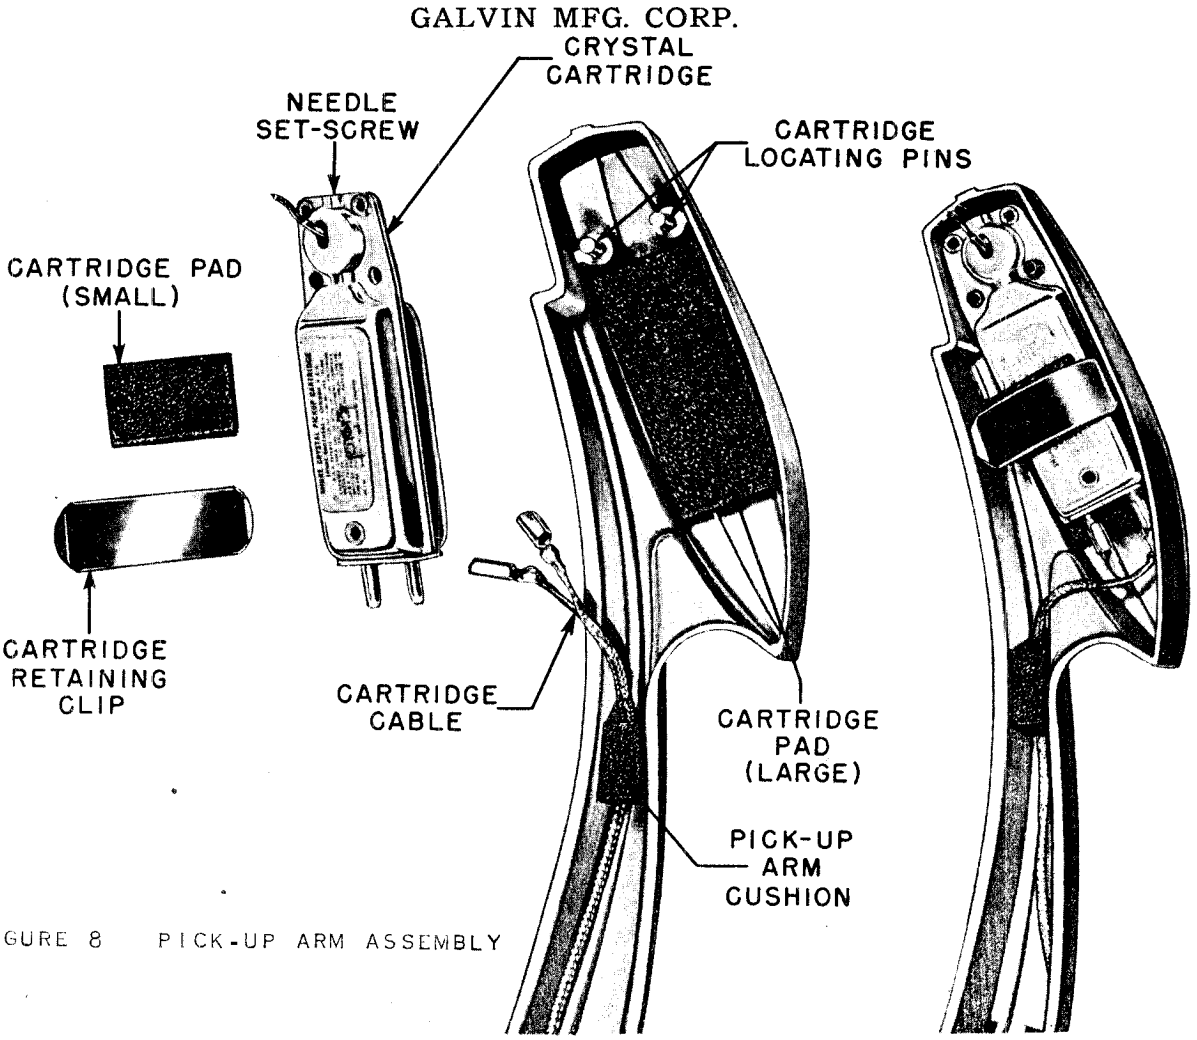

FIGURE 8 PICK-UP ARM ASSEMBLY

This changer is equipped with a permanent point (Sapphire or precious metal) long life needle and is good for several thousand plays, unless damaged by dropping or mishandling. For best results, use Motorola phonograph needles; they have been specially designed for use in these changers.

HOW TO REPLACE PHONOGRAPH NEEDLE

1. Models with external thumbscrew. - Obvious.
2. Models without thumbscrew. - Proceed as follows: Refer to Figure 8.
   a. Raise pick-up arm to a vertical position.
   b. With a pair of long nose pliers, remove the cartridge retaining clip.
   c. Lift the cartridge off the two rubber cartridge locating pins far enough to expose the setscrew on the end of the cartridge.
   d. Loosen setscrew and remove the old needle.
   e. Insert new needle, retighten setscrew, and reset cartridge on the two rubber locating pins.
   f. Place the rubber pad on the cartridge and replace the cartridge retaining clip. Use a pair of long nose pliers with which to replace clip.
   g. Lower pick-up arm to its original playing position.

ROUTINE CHECKS AND ADJUSTMENTS

LINING UP THE RECORD SUPPORT PLATFORM

It is important that all points on the "lip" of the record support platform be equidistant from the center point of the spindle. This will assure that all points of the record will leave the platform at the same time. If the record support is too far out of alignment, the record would actually hang on the point nearest the spindle and fail to drop properly. See Figure 9.

TO CHECK ADJUSTMENT OF RECORD SUPPORT PLATFORM

1. Turn the record support platform to the ten-inch position making sure it is turned so that the selector spring falls into the detent notch.
2. The record release eccentric should be perfectly aligned with the record post. If it isn't aligned, cycle the record player. If at the end of the cycle it still isn't aligned, adjust as described in ADJUSTMENT OF RECORD DROP MECHANISM.
3. Slip a standard 10 inch record over the spindle and cycle the record changer once to allow the record to fall on the turntable; then stop the changer.
4. Lift the record so it is in line with the record release eccentric and check to make sure it clears the lip of the record support platform equally at all points.

TO ADJUST RECORD SUPPORT PLATFORM

1. If one point of the record support platform lip is nearer the record than the other, the position of the support may be adjusted after loosening the two allen head set screws, located directly under the record support platform.
2. TEST: After tightening the set screws, test the adjustment by running a ten-inch record through a complete cycle and check the point where the needle falls. If the needle misses the record by one inch, the record support platform is 180 degrees out of line with the detent plate and should be turned one half turn without turning the detent plate.

ADJUSTMENT OF RECORD DROP MECHANISM

For minimum wear around the centerhole of records and proper automatic dropping of records, it is important that the record release eccentric and record post line up perfectly at the end of each change cycle.

TO CHECK ADJUSTMENT OF RECORD DROP MECHANISM

1. Cycle the record changer once, by pulling the reject button.
2. At the end of the cycle, stop changer and carefully observe the position of the eccentric with respect to the record post. It should line up perfectly with the record post.
3. If at the end of a cycle the eccentric does not line up perfectly with the record post, re-adjust as described below.

TO ADJUST THE RECORD DROP MECHANISM

1. Pull the reject button and slowly revolve the turntable by hand until the gear arm roller is resting on the raised section of the record release guide groove. See Figure 5 for its location. The raised section of the groove is very small and resembles what is often taken for flash on castings. It serves to narrow down the guide groove at this point and in this manner insures closer alignment of eccentric and record post.
2. Loosen the slab head set screw in the spindle gear. The eccentric will now turn freely. See Figure 5.
3. Turn the eccentric so it is in perfect alignment with the record post.
4. Tighten slab head set screw in spindle gear.

©John F. Rider

MODEL B-24RC

GALVIN MFG. CORP.

LATERAL ADJUSTMENT OF PICK-UP ARM

This adjustment is made to cause the needle to drop between the edge of the record and the first groove of the record as the changer completes a changing cycle.

TO CHECK & MAKE LATERAL ADJUSTMENT OF PICK-UP ARM

1. Turn the record support to the twelve-inch position.
2. Place a standard twelve-inch record on the turntable and a ten-inch record on top of it.
3. Start the changer and allow it to go through its cycle.
4. Note point at which the needle contacts record. It should fall into the middle of the area between the first groove and the edge of the record.
5. If it doesn't fall into the area, recycle the changer and stop the machine just as the pick-up comes down and is about to touch the record.
6. With a screwdriver, loosen the adjustment lockscrew (See Figure 10) and then turn the adjustment screw until pick-up is positioned correctly over the middle of the area between the edge and the first groove in the record. Turn the adjustment screw in a counter-clockwise direction to move the pick-up arm farther from center and in a clockwise direction to move it towards center of record.
7. Tighten the adjustment lockscrew. *Use care in locking, as too much pressure may crack the casting.*
8. Check the adjustment by putting the changer through its cycle.
9. If further adjustment is required, repeat above steps 1 through 7.
10. Turn the record support to the ten-inch position and cycle the changer. The needle should come down into the area between the first groove and the edge of the ten-inch record. If necessary, make minor compromise adjustment so needle will come down properly on both ten and twelve-inch records.

ADJUSTMENT OF THE LIMIT STOP

The limit stop mechanism permits the record changer to operate even though the record may not have an eccentric groove or if the eccentric groove is too close to the center hole.

Before checking or making adjustment on the limit stop, make sure the lateral adjustment is O.K.

TO CHECK LIMIT STOP ADJUSTMENT

1. Scribe a 3-3/4" diameter circle on a piece of stiff paper. Cut out a 1/4" hole at the center of the circle and slip the paper over the record post of the record player. See Figure 11.
2. Set up the record changer for twelve-inch records.
3. Turn on the record player, momentarily push the button to the reject position and allow the changer to complete one cycle. Stop the changer; the pick-up arm should now move freely.
4. Grasp the pick-up arm and slowly move it towards the record post. As the pick-up needle crosses the scribed circle line, the trigger should be heard to "click over".
5. Should the trigger mechanism be actuated before or after crossing the scribed line, readjust as described below.

©John F. Rider

GALVIN MFG. CORP.

TO ADJUST THE LIMIT STOP

1. Move the pick-up arm to its resting post.

2. Reset the trigger mechanism by moving the button momentarily to the **MANUAL** position and then back to **AUTOMATIC** (center position).

3. With a screwdriver, adjust the limit stop adjustment screw, which is located on the trip arm. See Figure 11. Turn the screw clockwise if the trigger is tripped after the needle crosses the scribed line, and counter-clockwise if it trips too soon.

4. Check adjustment by moving the arm manually across the scribed line.

5. If the adjustment is still not correct, repeat above steps 1, 2, 3, 4 and 5 until it is correct.

VERTICAL ADJUSTMENT OF PICK-UP ARM

This adjustment assures that:

1. The pick-up arm rests properly on the first record.

2. The pick-up arm will clear a full stack of records (10 ten-inch or 8 twelve-inch) on the turntable, during the changing cycle.

3. There will be sufficient clearance between the top of the pick-up arm and a record in position on the record support, during the changing cycle.

4. There will be sufficient clearance between the pick-up arm and the pick-up resting post during the changing cycle.

TO CHECK VERTICAL ADJUSTMENT OF PICK-UP ARM

1. Turn the record support to the twelve-inch record position and cycle the record changer. As soon as the changing cycle is complete, turn off the changer by means of the left hand button. The pick-up arm should now be resting alongside the turntable. Correct adjustment is indicated if the pick-up needle is exactly level with the top of the turntable.

2. Fully load the record changer with records. Use 10 ten-inch or 8 twelve-inch records of standard manufacture only. Start the changer and drop one record on the turntable. The pick-up should come down and rest normally in the playing position on the record.

3. Push the left hand button to the **REJECT** position momentarily and release. Now as the pick-up is lifted off the record, carefully note that there is clearance between the top of the pick-up arm and the bottom record on the record support.

4. Drop the full load of records (10 ten-inch or 8 twelve-inch) on the turntable. As the record changer is cycled, note the clearance between the pick-up needle and the top record.

ADJUSTMENT OF VERTICAL TRAVEL OF PICK-UP ARM

The pick-up rod (Figure 12) controls the vertical movement of the pick-up arm.

1. After the changer has completed its cycle and pick-up arm is resting in playing position, stop the changer by pushing the left hand switch to **OFF**. The pick-up rod will now be resting on the bottom of the inclined section of the main cam wheel and the pick-up arm will be at its lowest point of vertical travel.

2. Lift the pick-up arm straight up, exposing the pick-up rod. With long nose pliers, bend the pick-up rod (along its straight portion) in the required direction till the pick-up needle point is level with the top of the turntable. See Figure 12.

3. Re-check as shown under TO CHECK VERTICAL ADJUSTMENT OF PICK-UP ARM. In some cases minor compromise adjustment will be required.

©John F. Rider

MODEL B-24RC

GALVIN MFG. CORP.

ECCENTRIC STUD ADJUSTMENT

This adjustment varies the amount of pressure with which the drive pulley bears against the turntable rim, when the changer is in cycle. It is located on the bell crank arm; see figure 1A for location.

If this adjustment is too loose, the record changer may not cycle; if too tight, it may keep cycling continuously or lock in cycle.

CHECK AND ADJUSTMENT OF ECCENTRIC STUD

1. Turn eccentric stud to minimum throw position.
2. Pull reject button and revolve turntable.
3. Slowly increase adjustment until drive wheel contacts inside rim of turntable for one complete revolution of turntable.
4. Then increase adjustment almost 1/8 turn to compensate for wear, etc.

SERVICE INFORMATION

MECHANISM IS SLOW IN STARTING OR MOTOR HEATS UP:

1. Check lubrication.
2. Dirt in bearings. - Wash dirt out with carbon tetrachloride or similar solvent and re-lubricate. Use a #10 motor oil in the phono motor and turntable bearings and Lubriplate #105 grease on all other bearings and moving parts.
3. Check line voltage and frequency.
4. Motor damaged. If found damaged, remove motor and return it to factory for repair or replacement.
5. Room temperature abnormally low.
6. Eccentric stud adjustment set at maximum throw causing cycle drive wheel to drag on turntable rim. Correct by setting eccentric stud per instructions under ECCENTRIC STUD ADJUSTMENT.
7. Loose sleeve on motor drive shaft. - Replace motor.
8. Slow motor. - Replace motor.
9. Turntable retaining washer too tight against turntable.
10. Defective turntable bearing. - Replace.
11. Grease on rubber rim idler wheel and/or inner rim of turntable. - Clean off with carbon tetrachloride.

MOTOR FAILS TO RUN:

1. Check to see that ON-OFF switch is OK and that power is being supplied to motor.
2. Trouble in motor winding. If easily seen, repair; otherwise, replace.
3. Damaged or frozen bearings. - Replace motor.
4. Gummed oil or foreign material between armature and pole-piece. - Clean out.

SQUEAKS OR OTHER NOISES, DURING PLAYING OF RECORDS

1. Check lubrication (if squeeks are heard, they will usually be found to come from the records - not from mechanism).
2. Compare the squeak with and without a load of records. If squeak disappears when records are removed, then noise is obviously from records. Correct by rubbing a little wax on the turntable record post.

CHANGER IS NOISY WHEN IN CYCLE:

1. Check lubrication.
2. See if any part has become loose or bent and is rubbing against a moving part.
3. Check center post eccentric shaft lubrication.

©John F. Rider

GALVIN MFG. CORP.

"WOW" IN RECORD REPRODUCTION:

1. Record is warped or otherwise defective, or the instrument is not being operated at normal room temperature (70° F).

See CHECK THE RECORD FIRST on page 2.

2. May be caused by slippage due to grease on idler wheel or inside rim of turntable.

PICK-UP ARM TRIPS OUT OF OSCILLATING GROOVES.

1. Record changer not level.

2. Rough surface on catch surface of small trip arm. - Repolish.

3. Ratchet arm bent too close to trip pawl. - Bend away slightly.

4. Pick-up arm main shaft binding in bearing.

(a) Ream out the hole. (b) Sometimes the trip arm may be too close to the base, causing a bind. - To remedy loosen its two setscrews and space lightly.

5. Selector lever may be bent out of shape and binding against detent plate. - Straighten.

6. Selector lever slot or retaining rivet on detent plate may be undersize or oversize respectively, effectively causing a binding feeling on the pick-up arm. - Correct by spreading slot in selector lever.

7. Record may have oscillating groove covered with paper nameplate. - Remove paper from oscillating groove.

8. Needle may be chipped. Replace.

CHANGER KEEPS CYCLING.

1. Eccentric stud adjustment set too tight. - Correct per instructions found under ECCENTRIC STUD ADJUSTMENT.

2. Catch surface of small trip arm or ratchet arm worn to improper angle causing slipping apart of mating surfaces. - Correct by replacing parts.

3. Bell crank torsion spring may be too weak. - Replace.

4. Small trip arm may not be lifted far enough by the trigger reset extrusion to reset the trigger and end the cycle. - Correct by "doting", with a center punch, the trigger reset extrusion of the main cam wheel as shown in Figure 13. This operation expands the die cast cam at that point and gives a greater lifting movement to the small trip arm during the trigger reset portion of the cycle.

5. Manual lever wedges itself between small trip arm and base. - Correct by slightly bending the manual lever away from the record changer base.

CHANGER WILL NOT CYCLE.

1. Weak pawl spring causing non-mating of pawl on ratchet arm teeth. - Replace spring.

2. Pawl frozen on trip arm. Check for cause; if other than due to dirt or grease, replace entire trip arm and selector lever assembly.

3. Binding drive arm or main cam wheel on shaft. - Replace parts or remove burrs.

4. Eccentric adjustment stud set at minimum throw. Cycling drive wheel is not against inner rim of turntable. - Correct by setting up as shown under ECCENTRIC STUD ADJUSTMENT.

5. Weak bell crank arm spring. - Bend bracket to tighten spring.

6. Bell crank arm binding on shaft.

NEEDLE SETS DOWN ON RECORD WITH A WHIP MOTION

1. Pick-up arm centering cam not seating properly during cycle caused by pick-up arm rod pushing against its guide bracket. Correct by bending guide bracket forward to relieve pressure. See Figure 12.

RECORD WILL NOT DROP WHILE CYCLING:

1. The record release in the spindle assembly may not be protruding out enough from the spindle assembly. It should stick out as far as the eccentric does when the eccentric is picking up a record. If it doesn't and trouble persists, replace spindle assembly.

2. Eccentric out of line with record post. - Correct as shown in ADJUSTMENT OF RECORD DROP MECHANISM.

3. Set screw loose on spindle gear. - Tighten.

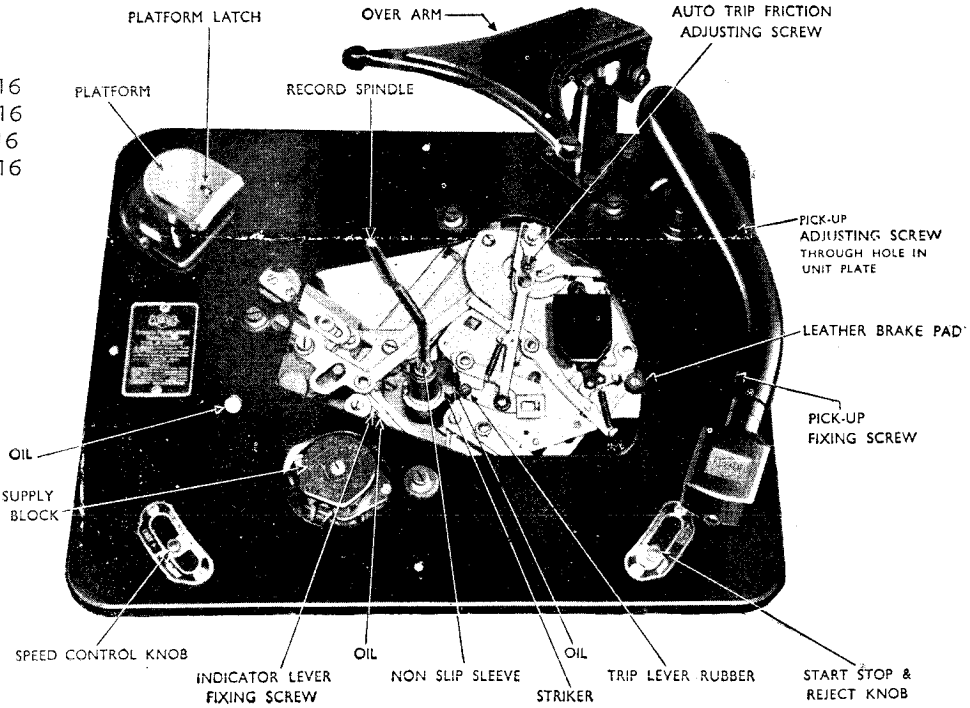
RC 60/L16
RC 60/U16



OPERATING INSTRUCTIONS.

The Garrard Model RC 60 Record Changer will play any number of records up to eight 10″ and 12″ mixed in any order.

To operate proceed in the following order:

1. If a permanent needle is not used insert a needle—the type that will play 10 or more records—in the pick-up; turn head to do this.
2. Place the record spindle in position, the sloping part leaning towards the record platform, raise overarm, and place any number up to eight records on the record spindle, their lower edge resting on the record platform, then lower overarm.
3. Move the right hand knob to "start". The motor will start and the changer operate. When the last record has been played the changer will automatically stop.

To remove records, raise overarm and withdraw the record spindle.

To reject a record, move the right hand knob to the reject position.

The Record Changer can be stopped by moving the right hand knob to the "stop" position.

Connected to the "start" and "stop" knob is the reject mechanism. If the changer is switched off while playing a record, the reject comes into operation when switching on again, the pick-up returning to its rest position.

NOTE.

If the Record Changer has been stopped for any reason, with the pick-up arm not on the rest, the arm should not be interfered with but the motor restarted and the arm allowed to return to the rest.

INSTALLATION.

DIMENSIONS.

The cabinet space required for fitting is 15½in. long by 13in. wide with 5½in. clearance above and 4½in. clearance below unit plate.

FITTING TO CABINET.

The "GARRARD" Model R.C.60 Record Changer is supplied with spring mounting to prevent mechanical feed-back occuring between the loudspeaker and the pick-up, and clearance should be left between the unit plate edges and the cabinet to allow the changer to float freely.

A template is supplied with each Record Changer and the instructions on it should be carefully followed.

After installing, see that the Changer is level by placing a spirit level on a record on the turntable. If not level, adjust by means of the spring mounting fixing screws. Finally, the nuts and threads of the spring mounting fixing screws should be coated with a locking paint such as shellac varnish to prevent the nuts working loose due to vibration.

VOLTAGE.

The "GARRARD" Model R.C.60 Record Changer is supplied in the following types:—

R.C.60/D16 Dual Voltage Range 100/130 and 200/250 volts 40/60 cycles.
R.C.60/H16 High Voltage Range 200/250 volts 40/60 cycles.
R.C.60/L16 Low Voltage Range 100/130 volts 40/60 cycles.
R.C.60/U16 Universal Voltage Range 100/130 and 200/250 volts D.C. and A.C. 25/60 cycles.

©John F. Rider

On installation, the links in the terminal block on types D16 and U16 should be set to the correct position to correspond with the voltage of the power supply, as shown in diagrams 2 to 5.

Dia. 2. *Dia. 3.*

Link Connections, RC 60/D 16

Dia. 4. *Dia. 5.*

Link Connections, RC 60/U 16

On types H16 and L16 connect the leads from the power supply to the terminals, taking care that the voltage is correct for the motor.

A red terminal block cover is fitted to the Universal type (R.C.60/U16).

A brown terminal block cover is fitted to the A.C. types (R.C.60/D16, R.C.60/H16 and R.C.60/L16.)

The motor should be earthed by connecting a lead from the earthing tag, located under one of the motor end cover screws and a good earth connection.

When adapting an AC/DC (Universal) Radio Receiver, Amplifier or one using a D.C. Power Pack for the reproduction of gramophone records, a pick-up transformer or condensers in series with the pick-up leads should be fitted, otherwise the pick-up circuit becomes alive. Also, the leads from the radio set or amplifier to the pick-up should be as short as possible in every case.

MAINTENANCE.

The motor only requires occasional lubrication at intervals, depending upon the length of time the Record Changer is used. Lift off the turntable and the oil holes (diagram 1) are accessible. A few drops of "GARRARD" or thin lubricating oil are sufficient.

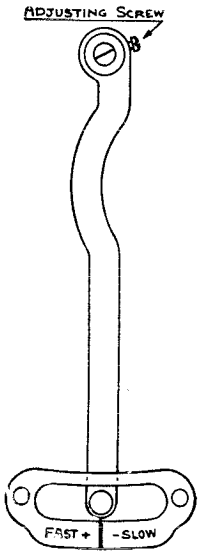
RECORDS should be reasonably flat and clean to obtain good reproduction. Care should be taken in storing to prevent contact with dirt and dust which sets up abrasive action and causes rapid wear.

RC 60/U 16 MOTOR.

Periodical examination of the carbon brushes should be made. If they are allowed to become dirty or worn, brush noise will occur. The brushes can be cleaned by lightly scraping the contact surface with a pen-knife. It is essential that the brushes be replaced in the same holder and the same way round New brushes are 9/16in. long under the springs. When worn down to 3/8in. they should be replaced. To remove the brushes, unscrew the brush caps and the brushes can be withdrawn.

SERVICE ADJUSTMENTS.

SPEED SETTING.



Due to the wide voltage range of the motors it may be necessary on some power supplies to make a slight re-adjustment of the speed indicator lever so that the speed of the turntable corresponds with that shown on the indicator scale.

To set the speed on alternating current power supply, 40/60 cycles, use the "GARRARD" Stroboscopic Speed Indicator enclosed with each Record Changer. To set speed on direct current power supply the turntable speed should be checked with a watch. Set speed so that turntable revolves at 78 r.p.m., remove the turntable and carefully loosen the screw holding the indicator lever to the vertical brake shaft, move the indicator lever to the centre position on the indicator plate and tighten up the screw. The speed should now be correct.

NOTE. One side of the stroboscopic speed indicator is designed for use in adjusting speed on a 50 cycle, and the other side a 60 cycle power supply.

MOTORS. If the motor fails to start when the control knob is turned to "start", first check the power supply and ascertain if current is reaching the motor terminals.

Next examine the terminal block and see that the leads and screws are tight; also examine the switch contacts, clean and adjust if necessary.

If a thick oil has been used to lubricate the motor bearings the motor will appear weak or will not start. It will be necessary to dismantle the motor and clean away all traces of the thick oil It is, therefore, essential to lubricate the motor bearings with a good quality thin oil.

Should the motor get too hot, first see that the voltage change-over links are set correctly to correspond with the voltage of the power supply.

To check the motor windings insert a milliameter in either motor lead. The maximum current consumption should not exceed:—

R.C.60/D16 { R.C.60/H16 200/250 volts 0.11 amp.
R.C.60/L16 { 100/130 volts 0.22 amp.
110 volts 60 cycles 0.24 amp.

If readings in excess of the above figures are obtained, the motor unit or coils should be returned for examination.

Wavy or watery reproduction from records is often due to dry governor pads. These should be lubricated by saturating the felt pads with oil.

To cure governor rattle, put a little thick oil on the shaft where the governor sleeve slides.

REMOVING MOTOR.

If the motor has to be removed from the Record Changer, disconnect the switch leads from the switch and remove the clips holding the leads, then remove the motor fixing screws and the motor can be withdrawn.

PICK-UP DROPPING POSITION.

The pick-up arm has been finely adjusted so that the needle comes on to 10in. records in a 9⅝in. diameter circle and 12in. records in a 11⅝in. diameter circle These positions were arrived at after checking a very wide selection of records of various makes.

There may be a few records where the record track starts further away from the centre, (i.e., nearer the edge), and in these exceptional cases the

©John F. Rider

needle may alight on the record a few grooves from the start of the record. If the pick-up dropping position were set for these exceptional records it would not be suitable for average records.

Should the dropping position of the pick-up require adjustment the pick-up adjusting screw—accessible through a hole in the unit plate—should be turned with the Changer in its start position; that is, with the pick-up arm on its rest.

The pick-up adjusting screw should be turned either to the right or left, according to requirements. A quarter of a turn in either direction will give you the maximum adjustment. After adjustment, switch on, check the dropping position and re-adjust if necessary.

PICK-UP HEIGHT.

If desired the pick-up height can be adjusted by removing the screw in the collar at the bottom of the pick-up arm lifting spindle and turning the collar, whilst holding the spindle. Replace screw and tighten after adjustment.

CAUTION. When making any adjustments to the pick-up arm, it should NEVER on any account be forced into position. If the turntable is turned by hand it should NOT be turned backwards.

If the pick-up does not run into the record grooves after alighting on the record edge, see that the record changer is level by placing a spirit level on a record on the turntable. Also make sure that the flexible wire leading to the pick-up is not twisted or held in such a manner as to prevent the free movement of the pick-up arm; also see that the associated levers are free.

AUTO TRIP MECHANISM.

The satisfactory operation of the Record Changer depends upon the operation of the auto. trip. Occasional adjustment of the auto. trip friction spring may, therefore, be necessary.

If, at the end of a record, the auto. trip does not operate—that is, the pick-up remains at the end of a record—first see that the record has a run off groove in its centre, as only records with run off grooves can be played automatically on Record Changers. If the record is in order, increase the tension of the friction spring by turning the friction adjusting screw (on diagram 1) in a counter-clockwise direction; about half a turn is all that should be necessary. This screw is accessible on removing the turntable.

When the changer operates before the end of a record or a bumping or tapping noise is audible, first examine the trip lever rubber and, if worn, give it a half turn to present a new surface to the striker. If badly worn, renew. If trip lever rubber is in good condition then reduce the tension of the friction spring by giving the auto trip friction adjusting screw (diagram 1) half a turn in a clockwise direction.

RECORD PLATFORM ADJUSTMENT.

When despatched from our works the record platform is set to accommodate records of average dimensions. Occasionally, however, records may be found outside the normal limits; if necessary, therefore, the platform may be adjusted to take them.

To control the platform movement are two adjustable links, each fitted with two screws. One link, with its pivot at the bottom of the platform lever, controls the platform lift, whilst the other controls the distance the platform moves inward.

It is this latter link which may be adjusted to accept records differing from the normal in diameter. To do this, loosen the screw further away from the platform and remove the other screw.

Now refit this screw in an adjacent hole according to the adjustment required. Moving the screw to a hole nearer the platform lengthens the link and increases the inward movement of the platform. By moving the screw in the opposite direction the link is shortened and the outward movement of the platform increased. The permissible adjustment is one hole in either side of existing position of the screw.

PICK-UP.

"GARRARD" Magnetic types of pick-up are interchangeable with the Crystal type or vice-versa without alteration to the pick-up arm on these Record Changers, provided the pick-up is fitted in a "GARRARD" head.

All "GARRARD" pick-up heads are of the plug-in type, connections being made by two plugs and sockets at the back of pick-up head.

To remove the pick-up head, unscrew the pick-up fixing screw, withdraw the pick-up, easing the pick-up lead under the arm, and remove the two plug connections from back of pick-up.

If reproduction ceases, or becomes distorted when fitted with a "GARRARD" standard magnetic pick-up, first make sure that the amplifier is in order. Should this be found satisfactory, a slight adjustment to the pick-up may be necessary or the damping rubber may need renewing.

To examine pick-up proceed as follows:—Remove the pick-up cover, and by viewing the front of the pick-up, examine armature to see that it is in the centre of the gap between the pole pieces.

If it is touching one of the pole pieces it must be re-centred. To do this, loosen the two screws holding the adjusting plate, sliding the latter until the armature is in the centre, then tighten the screws.

If the armature will not retain its centre position, it will be necessary to renew the damping rubber. This can be done by removing the adjusting plate, replacing the rubber and re-assembling the plate.

Adjust the plate until armature is centred before tightening the screws.

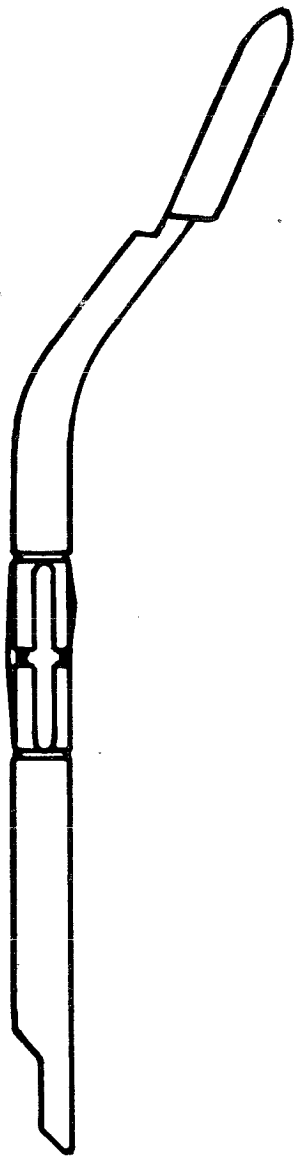
The top damping rubber tends to perish in time. It should, therefore, be replaced whenever it appears that the needle stiffness has increased, otherwise excessive record wear may occur.

Distortion can be caused by dirt or foreign matter in the gap between the pole pieces. To remedy, remove the adjusting plate and damping rubber and clean gap

The pick-up coil winding can be checked for continuity with an ohmmeter.

If a Crystal or High Fidelity pick-up is suspect the pick-up head should be returned for examination. A continuity test cannot be carried out on Crystal pick-ups with an ohmmeter.

Crystal Cartridges or High Fidelity pick-ups must not be opened or the Manufacturers will disclaim all responsibility.



TEMPLATE FOR RC 60 RECORD SPINDLE.

Should the record spindle be accidentally bent out of position through being dropped or other reasons, the record dropping will be affected. If trouble is experienced with erratic record dropping, lay the record spindle on template and check that it conforms to the shape thereof.

AUTOMATIC RECORD CHANGER SERVICE INSTRUCTIONS

MODEL 204

The Model 204 Record Changer is an automatic cam type changer, featuring Single Button Control, Automatic Shut-Off, and Eccentric Spindle Record Selection.

OPERATION

Single Button Control . . . Initial depression of the Single Button Control (6) not only actuates the Mercury Switch (13) but at the same time contacts the Automatic Trip Bar (14). The motion of the Automatic Trip Bar (14) causes the Carrier Lever (31) and its attached Drive Wheel (10) to swing outward until the Drive Wheel (10) comes in contact with the rim of the turntable. The consequent revolving motion of the Drive Wheel (10) is transmitted to the Main Cam (15) through a Drive Spring (16) and Worm Drive (17) assembly.

Cycling . . . A single revolution of the Main Cam (15) results in complete automatic cycling of the changer. This includes selection of record from stack, lifting Pick-Up Arm (1) from rest position and setting needle on edge of record. Upon completion of the revolution, the Automatic Trip Cam (24) engages with the block on the Trip Lever (43) and pulls the Carrier Lever (31) back to its original position so that the Drive Wheel (10) is no longer engaged with the turntable rim.

Record Feed . . . The lower side of the Main Cam (15) controls record selection. Motion of the Feed Cam Roller (36) about the cam results in a backward and forward movement of the Feed Sector Lever (19) thus engaging the Record Feed Pinion (20). This in turn causes the Eccentric (35) to first rotate to proper position for record selection and to then return, allowing record to drop over Spindle (3).

Pick-Up Arm Movement . . . The upper side of the Main Cam (15) controls Pick-Up Arm (1) movement. *Lift* is effected by motion of the Lift Pin (25) along the vertical edge of the cam as the latter rotates. *Direction* is controlled by the engagement of the Main Cam (15) with the Sweep Lever Pinion (26). The Sweep Lever (27) is attached to the Pick-Up Arm (1) by means of a Clamp (28) around the Pick-Up Arm Pivot Sleeve (29). A boss projecting from the upper side of the Main Cam (15) displaces the Stop Lever (30) at the end of the change cycle, thus permitting the Pick-Up Arm (1) to proceed across the record.

Positive Trip Action . . . As the Pick-Up Arm (1) approaches the spindle assembly, the Sweep Lever (27) hits the Positive Trip Screw (37) mounted on the Trip Lever Assembly (43). This action re-engages the Drive Wheel (10) with the turntable rim and starts a new cycle.

GENERAL INSTRUMENT CORP.

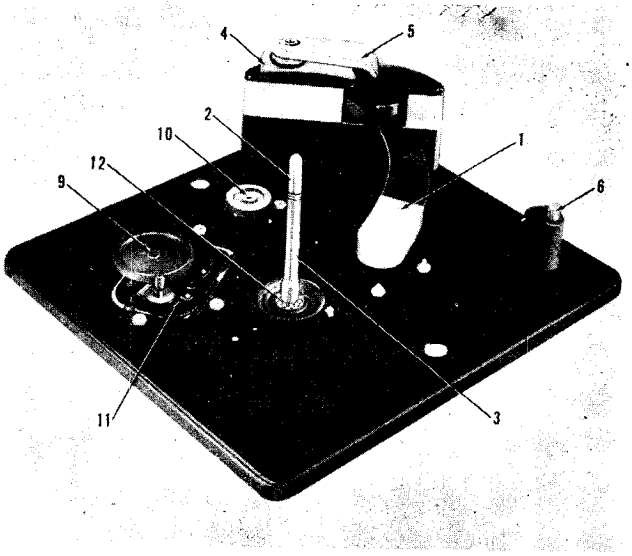

FIGURE 1

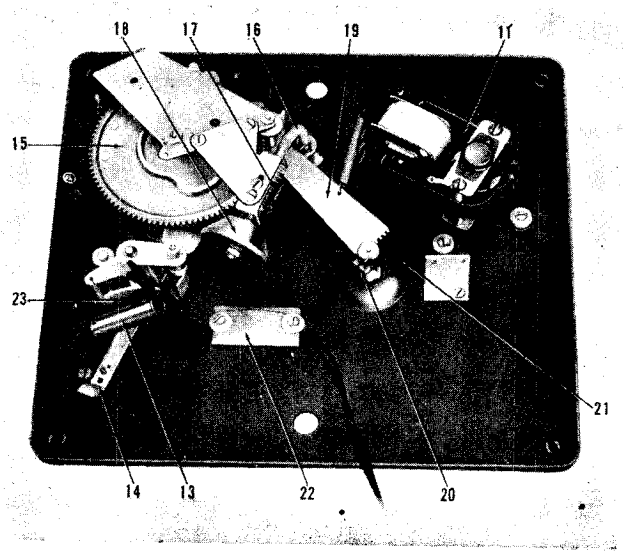

FIGURE 2

Pawl Trip Action . . . Any reversal of the direction of the Sweep Lever (27) travel before positive trip action takes place causes the Sweep Lever (27) to push forward the Pawl (38) mounted on the Auxiliary Trip Lever (34). This movement also has the effect of re-engaging the Drive Wheel (10) to start a new cycle. *(Pawl trip action is effective only after the Pick-Up Arm (1) reaches a distance of not more than four inches from Spindle (3).)*

Ten Inch or Twelve Inch Operation . . . Adjusting the Record Support (4) to the ten inch or twelve inch position lowers the Selector Rod (39) a definite degree. The length of the extension of this rod determines the position of the Stop Selector Lever (40) which in turn controls the Stop Lever (30). The latter is the means of regulating the distance the Sweep Lever (27) and its attached Pick-Up Arm (1) travel before the Pick-Up Arm (1) is lowered to the edge of the record. (Operation of this feature is dependent on proper positioning of Record Support (4). *Always turn Record Support (4) to full stop.)*

Automatic Shut-Off . . . Release of the Record Stabilizer Finger (5) lowers the Shut-Off Rod (41) and forces the Stop Selector Lever (40) completely clear of the Stop Lever (30). The latter is then able to move into a position which completely blocks any forward motion of the Sweep Lever (27). Consequently, the Sweep Lever (27) cannot perform its usual function of actuating the Switch Lever (32). Thus the Switch Lever Roller (33) remains in the path of the Stop Lever (30). On completion of the cycle, the Stop Lever (30), in returning to home position, hits the Switch Lever Roller (33) and forces the Mercury Switch (13) to the OFF position.

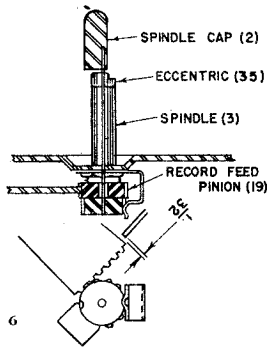

FIGURE 6

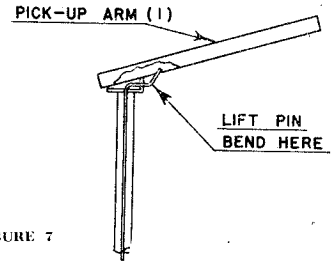

FIGURE 7

MISCELLANEOUS SERVICE ADJUSTMENTS

Changer trips before completion of record:

Turn Positive Trip Screw (37) clockwise.

Changer fails to trip after completion of record:

Turn Positive Trip Screw (37) counterclockwise.

Drop point of Pick-up Arm is not at proper point on record:

Loosen screw on Sweep Lever Clamp (28) slightly and reposition Pick-up Arm (1) with respect to Sweep Lever (27).

Slow turntable speed:

Make sure Drive Wheel (10) does not strike rim of turntable. If necessary, readjust eccentric bushing on Drive Wheel (10). (Note: This adjustment should be exceedingly slight as a large movement may cause continuous trip.)

Check for grease or oil on Idler Wheel (9) of Motor (11) and inside of turntable. Wipe with carbon tetrachloride.

Check for sticky Idler Wheel (9) plate on Motor (11). Free with screw driver.

Stalls in cycle:

Remove any grease on Drive Wheel (10) or inside of turntable with carbon tetrachloride.

Check mesh of Worm Drive (17) and Main Cam (15) for proper clearance. Loosen screws on main bracket and tighten. (See Figure 5.)

Check for bind in Spindle Assembly (See Figure 6). Disassemble index collar and Record Feed Pinion (20), remove Spindle Cap (2), Eccentric (35) and eccentric rod.

Check for freeness and remove binds.

The following cautions should be observed in reassembling Spindle Assembly:

(a) Reassemble with a maximum end play of .005 between Eccentric (35) and Spindle Cap (2).

(b) The Eccentric (35) should be in line with the Spindle (3) when the changer has completed its cycle.

(c) The Feed Sector Lever (19) should mesh with the Record Feed Pinion (20) as shown in Figure 6.

(d) Align Spindle Cap (2) with Spindle (3) in detent position.

Records fail to drop:

Check meshing of Feed Sector Lever (19) with Record Feed Pinion (20). Reset as shown in Figure 6.

First record does not play:

Readjust end of Lift Pin (25) so that needle will play first record. (See Figure 7.)

(Note: Do not bend Lift Pin (25) too much as this will prevent playing of top record on full stack.)

Make certain that pick-up lead does not hit top of Lift Pin (25) or hinge.

Automatic Shut-Off fails to operate:

Make certain that the Automatic Shut-Off Adjusting Screw (42) mounted on Stop Selector Lever (40) makes contact with the Shut-Off Adjusting Rod (41) when the Stabilizer Finger (5) is released. Adjust as required. Check leads on Mercury Switch (13) for interference with Switch Lever (32) motion. Check Mercury Switch (13) continuity.

AUTOMATIC RECORD CHANGER SERVICE INSTRUCTIONS

MODEL 205

The Model 205 Record Changer is an automatic cam type changer, featuring Single Button Control and Eccentric Spindle Record Selection.

OPERATION

Starting . . . After the Switch Button Control (6) has been turned ON, thus supplying power to rotate the turntable, automatic cycling may be started by depressing the button. This movement pushes the Trip Bar (14) forward, causing engagement with the Carrier Lever (27) and its attached Drive Wheel (10). The latter thus contacts the rim of the turntable and rotates with it. This motion is transmitted through the Drive Spring (16) to the Worm Drive (17), which in turn drives the Main Cam (15).

Cycling . . . A single revolution of the Main Cam (15) results in complete automatic cycling of the changer. This includes selection of record from stack, lifting Pick-Up Arm (1) from rest position and setting needle on edge of record. Upon completion of the revolution. the Automatic Trip Cam (26) engages with the block on the Trip Lever (34) and pulls the Carrier Lever (27) back to its original position so that the Drive Wheel (10) is no longer engaged with turntable rim.

Record Feed . . . The lower side of the Main Cam (15) controls record selection. Motion of the Feed Cam Roller (32) about the cam results in a backward and forward movement of the Feed Sector Lever (19) thus engaging the Record Feed Pinion (20). This in turn causes the Eccentric (35) to first rotate to the proper position for record selection and to then return, allowing record to drop over Spindle (3).

MODEL 205

GENERAL INSTRUMENT CORP.

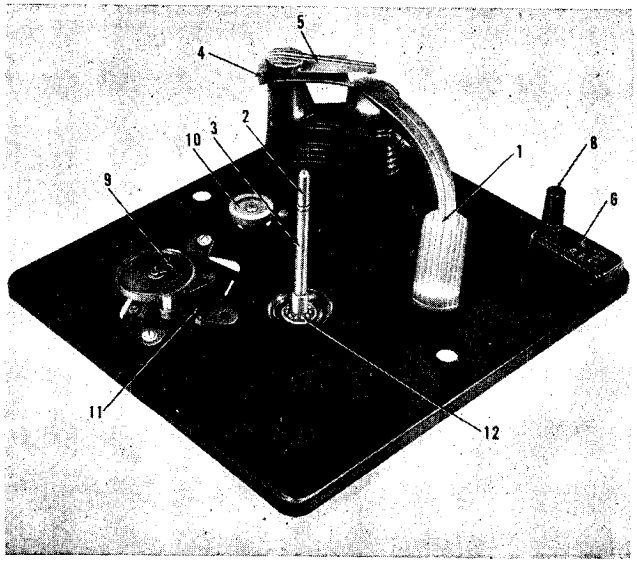

FIGURE 1

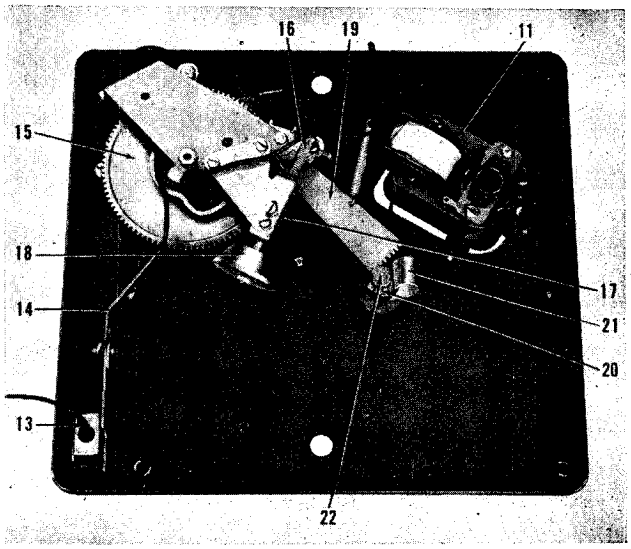

FIGURE 2

Pick-Up Arm Movement . . . The upper side of the Main Cam (15) controls Pick-Up Arm (1) movement. *Lift* is effected by motion of the Lift Pin (23) along the vertical edge of the cam as the latter rotates. *Direction* is controlled by engagement of the Main Cam (15) with the Sweep Lever Pinion (25). The Sweep Lever (29) is attached to the Pick-Up Arm (1) by means of a Clamp (24) around Pick-Up Arm Pivot Sleeve (30). A boss projecting from the upper side of the Main Cam (15) displaces the Stop Lever (28) at the end of the change cycle, thus permitting the Pick-Up Arm to proceed across the record.

Positive Trip Action . . . As the Pick-Up Arm approaches the Spindle (3), the Sweep Lever (29) hits the Positive Trip Screw (31) mounted on the Trip Lever (34). This action re-engages the drive wheel with the turntable rim and starts a new cycle.

Ten Inch or Twelve Inch Operation . . . Adjusting the Record Support (4) to the ten inch or twelve inch position lowers the Selector Rod (33) a definite degree. The length of the extension of this rod determines the positioning of the Stop Lever (28). The latter is the means of regulating the distance the Sweep Lever (29) and its attached Pick-Up Arm (1) travel before the Pick-Up Arm (1) is lowered to the edge of the record. (Operation of this feature is dependent on proper positioning of Record Support (4). *Always turn Record Support (4) to full stop.)*

MISCELLANEOUS SERVICE ADJUSTMENTS

Changer trips before completion of record:

Turn Positive Trip Screw (31) clockwise.

Changer fails to trip after completion of record:

Turn Positive Trip Screw (31) counter-clockwise.

Drop point of Pick-Up Arm (1) is not at proper point on record:

Loosen screw on Sweep Lever Clamp (24) slightly and reposition Pick-Up Arm (1) with respect to Sweep Lever (29).

Slow turntable speed:

Make sure Drive Wheel (10) does not strike rim of turntable. If necessary, re-adjust eccentric bushing on Drive Wheel (10). (Note: this adjustment should be exceedingly slight as a large movement may cause continuous trip.)

Check for grease or oil on Idler Wheel (9) of Motor (11) and inside of turntable. Wipe with carbon tetrachloride.

Check for sticky Idler Wheel (9) plate on Motor (11). Free with screw driver.

Stalls in Cycle:

Remove any grease on Drive Wheel (10) or inside of turntable with carbon tetrachloride.

Check mesh of Worm Drive (17) and Main Cam (15) for proper clearance. Loosen screws on main bracket and tighten. (See Figure 5.)

Check for bind in Spindle Assembly (See Figure 6). Disassemble Index Collar (22) and Record Feed Pinion (20), remove Spindle Cap (2), Eccentric (35) and eccentric rod. Check for freeness and remove binds.

The following cautions should be observed in reassembling Spindle Assembly:

(a) Reassemble with a maximum end play of .005 between Eccentric (35) and Spindle Cap (2).

(b) The Eccentric (35) should be in line with the Spindle (3) when the changer has completed its cycle.

(c) The Feed Sector Lever (19) nould mesh with the Record Feed Pinion (20) as shown in Figure 6.

(d) Align the Spindle Cap (2) with the Spindle (3) in detent position.

Records fail to drop:

Check meshing of Feed Sector Lever (19) with Record Feed Pinion (20). Reset as shown in Figure 6.

First Record does not play:

Readjust end of Lift Pin (23) so that needle will play first record. (See Figure 7.) (Note: Do not bend Lift Pin (23) too much as this will prevent playing of top record on full stack.)

Make certain that pick-up lead does not hit top of Lift Pin (23) or hinge.

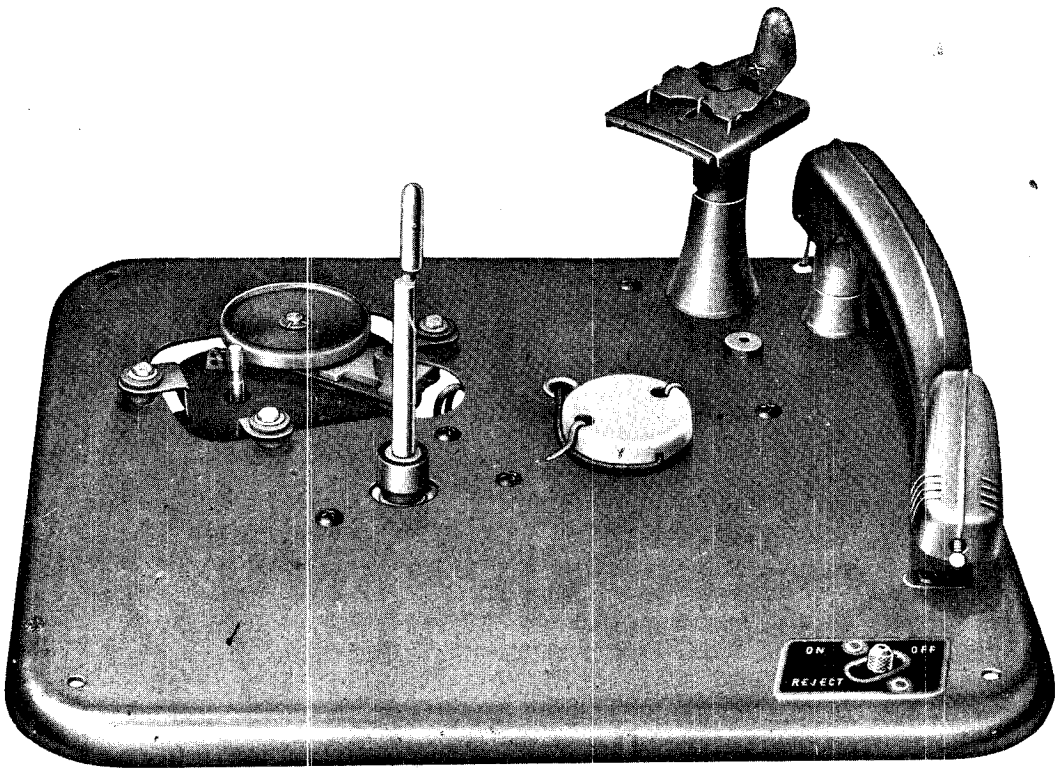
INTERNATIONAL DETROLA CORP.

GENERAL

This manual may be used for all versions of the Model 550 Automatic Record Changer. Some models require an insulated tone arm lead, readily identified on the unit. Model 550D has an extra lead to the switch. Models 550E and 550H have a special crystal cartridge, listed in the replacement parts list. Models 550F, 550G and 550H may be used on line current other than specified in this manual, by using a special motor. This changer is designed to operate on 105 to 125 volts, 60 cycle alternating current. It will play and automatically change twelve 10-inch or ten 12-inch records, not mixed. It is designed to have a minimum of moving parts, all readily accessible for adjustment and service.



©John F. Rider

INTERNATIONAL DETROLA CORP.

OPERATING INSTRUCTIONS

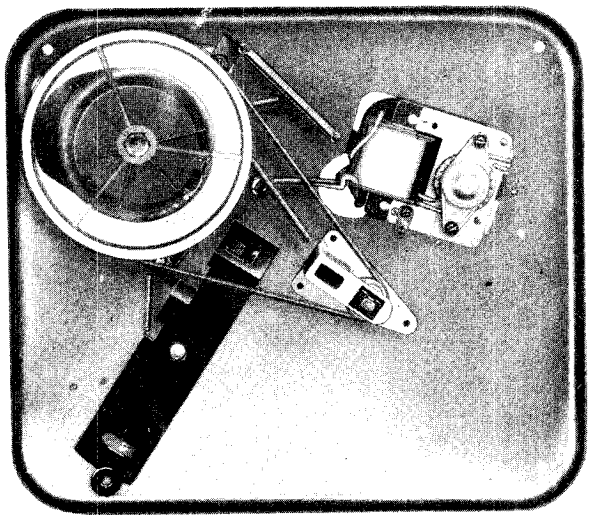
A brief summary of the Operating Instructions Manual, as supplied to the customer, is included below:

For automatic operation, engage the detent "A" on the tone arm hub. Position the record support shelf for the size records selected. (The wide ledge should be toward the spindle for 10-inch records; rotate 180° for 12-inch records.) Place a load of records on the support shelf and spindle; flip the toggle plate onto the stack of records. Push the control lever to the "On" position. After the conclusion of the last record, while the tone arm is still on the record, push the control lever to the "Off" position, place the tone arm on the rest.

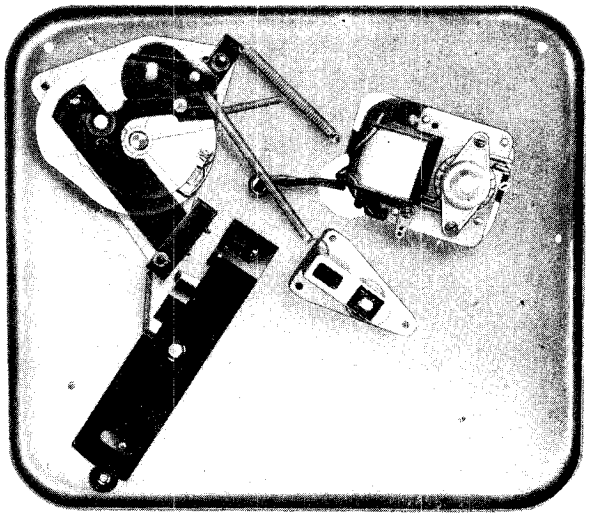
For playing single records, engage detent "H" on the tone arm hub; the record shelf should be in the 12″ position. Turn the control to "On", allowing the tone arm to raise and lower. Then place the tone arm by hand on the edge of the record.

Note: This changer has been designed to operate automatically, using all standard commercial records with an eccentric stopping groove, even those with an unusually large diameter stopping groove.

Manual operation is a secondary function of the unit and is included solely for playing home recordings or other non-standard records. Each time such a record is played, the tone arm must be allowed to raise and lower before it is positioned by hand on the record.



Bottom View—Cam phantomed through Drum.



Bottom View—Drum and Spring removed. Mechanism phantomed through Cam.

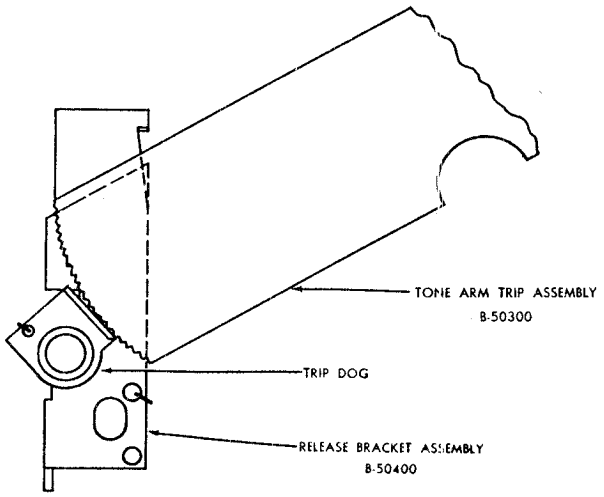
THE CHANGE CYCLE

An understanding of the methods used to accomplish the necessary mechanical motions will aid greatly in the diagnosis of any disorders of the mechanism. A careful study of the following outline should prove extremely valuable.

The mechanical functions of the change cycle, raising, moving and lowering the tone arm, and the ejection of records, are controlled by a cam. This cam is driven, during the change cycle only, by a drive dog on the cam engaging one of the bosses on the constantly revolving drum wheel. This wheel is driven from the turntable bearing by means of a belt. The turntable is rim driven from the motor.

©John F. Rider

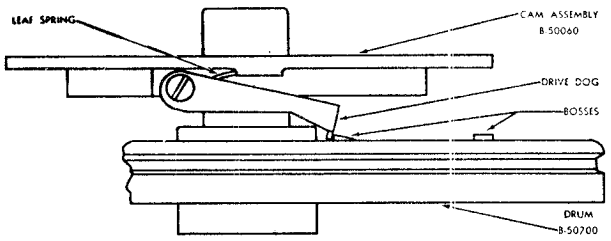
INTERNATIONAL DETROLA CORP.



The Change Cycle Sequence is as follows:

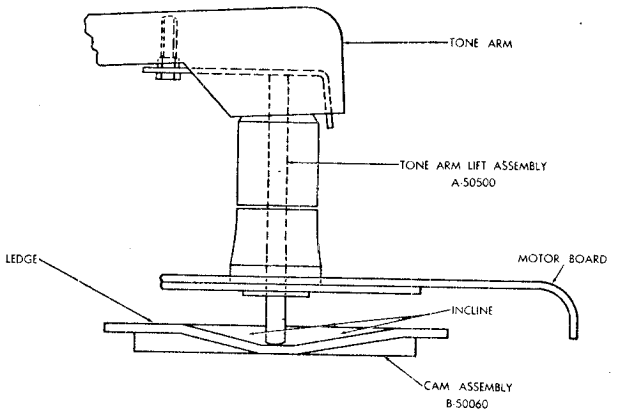
1. As the needle in the tone arm nears the end of a record, a lever with a serrated end moves with the tone arm and engages a trip dog pivoted on a release bracket.

2. The eccentric groove in the record causes the tone arm to oscillate. The backward motion of the tone arm and lever causes the trip dog to push against its pivot point, thus moving the release bracket away from the cam.

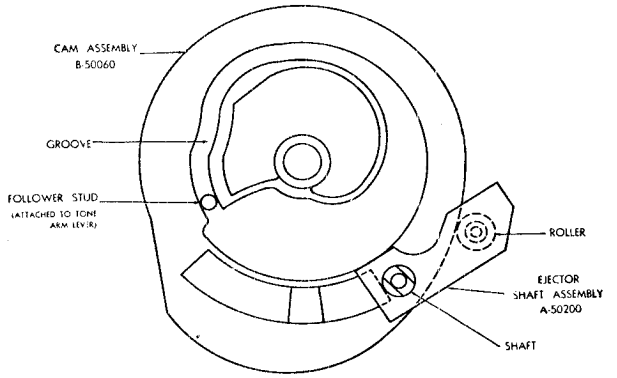


3. This allows the drive dog on the cam (which had been held by the release bracket) to drop down onto the drum and engage one of the bosses; the cam then rotates with the drum.

4. As the cam turns, the tone arm lift shaft rides up an incline to a ledge on the periphery of the cam, and thus raises the tone arm off the record. During most of the remainder of the cycle, the lift shaft rides this ledge, keeping the tone arm elevated.



5. A follower stud on the tone arm lever is pulled into a groove on the cam. As the cam rotates, this stud follows the groove and causes the tone arm to swing out beyond the edge of the record.



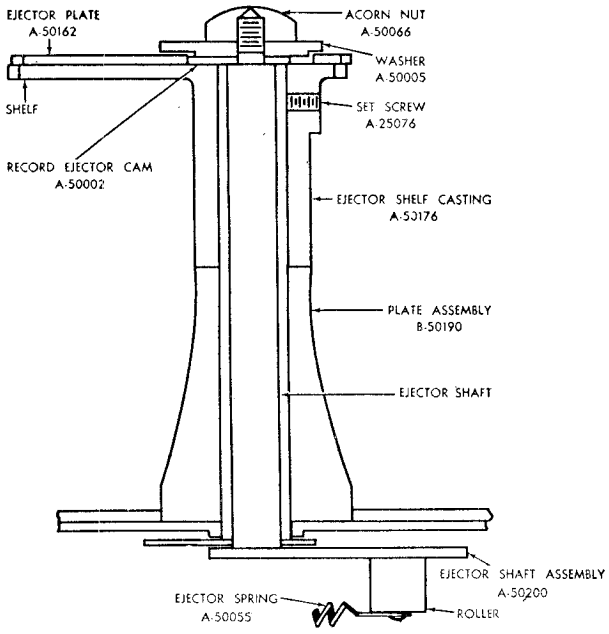
6. The shape of the cam is elliptical at one portion of the outer periphery. A roller attached to an ejector lever and shaft follows the outside periphery of the cam. As the cam revolves, the elliptical portion begins to push against the roller, causing the lever to move, thereby turning the shaft.

7. This shaft extends up through a casting to the record ejector shelf. A small record ejector cam, turned by this shaft, moves the ejector plate, pushing a record off the shelf.

8. The main cam continues to revolve; the roller rides around the elliptical portion of the cam, back to its original position, returning the lever, shaft, small cam and ejector plate to their original position.

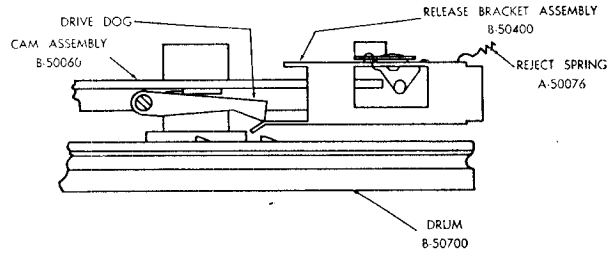
©John F. Rider

INTERNATIONAL DETROLA CORP.



9. The tone arm follower stud, still riding in the groove on the cam, causes the tone arm to return to a position over the outside edge of a record.

10. The tone arm lift shaft now rides down an incline from the ledge to a flat, thus lowering the tone arm to the record.



11. At this point, the drive dog on the cam is lifted off the boss on the drum by the release bracket, the cam ceases rotating and the change cycle is completed. The tone arm is now in position for reproduction of the record.

CAUTIONS

1. Before attempting to make any adjustments or replacements of parts on a changer, examine the records being used. Faulty records are frequently the source of trouble in these mechanisms. The machine will handle satisfactorily all standard 10-inch and 12-inch records in reasonable condition, but it cannot function properly with records that are too large or too small on their outer diameter, too thick or too thin, or which are chipped, especially around the center hole.

Standard specifications for 12-inch records are: diameter—11-27/32 to 11-29/32; thickness—1/16 minimum to 3/32 maximum; starting groove—11-1/2 diameter.

Standard specifications for 10-inch records: diameter—9-27/32 to 9-29/32; thickness—1/16 minimum to 3/32 maximum; starting groove—9-1/2 diameter.

2. Check all parts and springs to see if they are in place and in good condition before attempting any adjustments. Springs may suddenly go dead despite all factory precautions; set screws may work loose; rivets may have loosened, or parts may be damaged due to external tampering.

3. Never use force on any part of the changer. It is essential that all parts be straight and square for the proper operation of this mechanism. It is advisable to replace a bent part rather than to attempt to straighten it.

4. Factory lubrication of this changer is adequate for the normal life of the unit. However, if it is subjected to severe operating conditions, it is well to clean and relubricate the moving parts. A fine, light oil should be used on all bearing surfaces, except the main cam, which should be heavily lubricated with Lubriplate 105. AVOID "GUMMING" THE PRECISION FITTED PARTS. DO NOT APPLY TOO MUCH, OR TOO VISCOUS A LUBRICANT.

5. Exercise care when removing the cam and drum assembly, as the stud which holds this assembly to the plate assembly has a LEFT HAND THREAD.

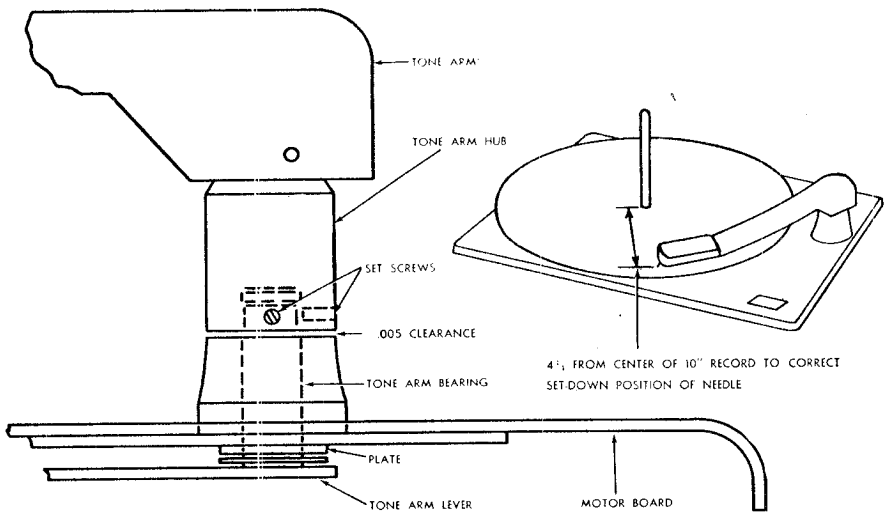
INTERNATIONAL DETROLA CORP.

ADJUSTMENTS



A—PICKUP POSITION

This adjustment is for correct positioning of the tone arm needle in the first groove of a record. The needle should set down at approximately 4-3/4 inches from the center of the spindle on 10-inch records. (Adjustment for 12-inch records is automatic when the 10-inch adjustment is made. Also see Note under Paragraph C

1. Position the record shelf for 10-inch records.

2. Place a standard 10-inch record on the turntable and start the change cycle.

3. Stop the mechanism while still in cycle, just as the tone arm begins its descent onto the record. At this point the tone arm follower stud will still be securely held by the groove in the cam, thus retaining all the working parts in their correct relationship.

4. Loosen the two set screws on the tone arm hub. The tone arm can now be moved carefully sideways, without disturbing any part of the mechanism.

5. Push upwards on the tone arm lever (near the bearing) from beneath the motor board, and hold it tightly against the plate.

6. On the top, insert a .005 shim between the tone arm hub and the boss on which it rests to obtain the necessary clearance.

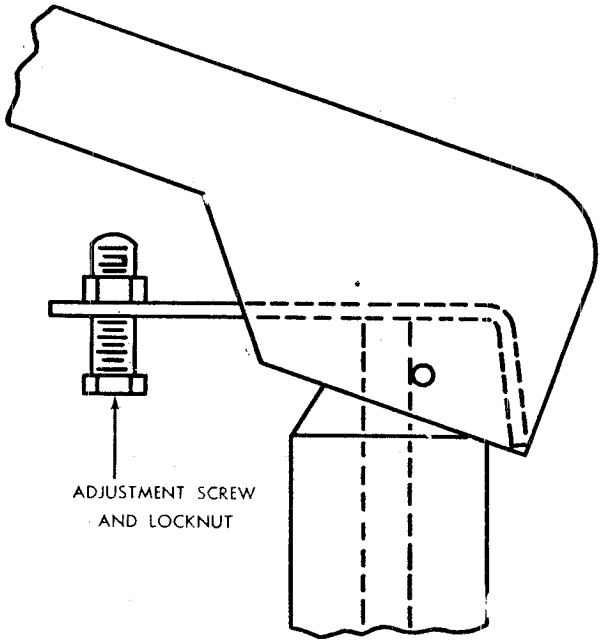
7. Place the tone arm in its correct position above the record. (Be sure to hold the lever firmly against the plate.) Tighten one set screw on the hub.

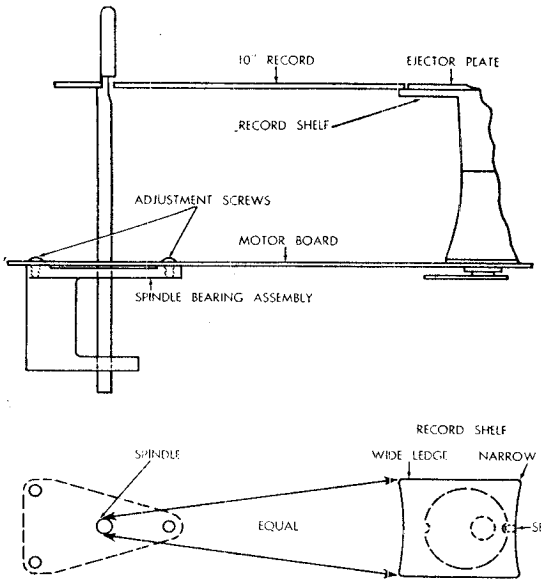
8. Run the changer through a few cycles, using several records to check the adjustment. Make a minor correction if necessary.

9. Tighten the other set screw on the hub and remove the shim.

©John F. Rider

INTERNATIONAL DETROLA CORP.





B—HEIGHT OF TONE ARM

This adjustment is made so that the tone arm will clear a stack of records when in cycle, yet will set down properly on the first record of a stack.

1. To increase the rise of the tone arm, lift the tone arm and loosen the nut on the tone arm lift assembly. Turn the screw counter-clockwise. Tighten the nut.

2. To decrease the rise, turn the adjustment screw clockwise.

C—RECORD SHELF POSITION

This shelf must be adjusted for the correct distance from the spindle as well as for correct alignment with the spindle.

(I) To Adjust the Distance

1. Remove the turntable by lifting upward. Loosen the three Phillips head screws that hold the spindle assembly to the motor board. Remove the drive-spring belt from the turntable bearing and the drum wheel.

2. With the record shelf in the 10-inch position (wide ledge toward spindle), carefully place a standard 10-inch record so that it rests on the shelf and on the ledge on the spindle.

3. Adjust the distance by sliding the spindle assembly toward or away from the shelf. The position should be such that the record will not fall off of either the spindle or the shelf, nor jam when the ejector plate pushes it, and when ejected, will fall clear of both shelf and spindle ledge. (See the Standards for record sizes listed under "Cautions'

4. Carefully tighten the screws and check the adjustment again, using several records. Replace the turntable, being careful to push the idler wheel of the motor under the edge of the turntable. Replace the belt.

(II) To Adjust Alignment

1. Loosen the set screw beneath the 12-inch shelf (narrow ledge). Have the 10-inch shelf toward the spindle.

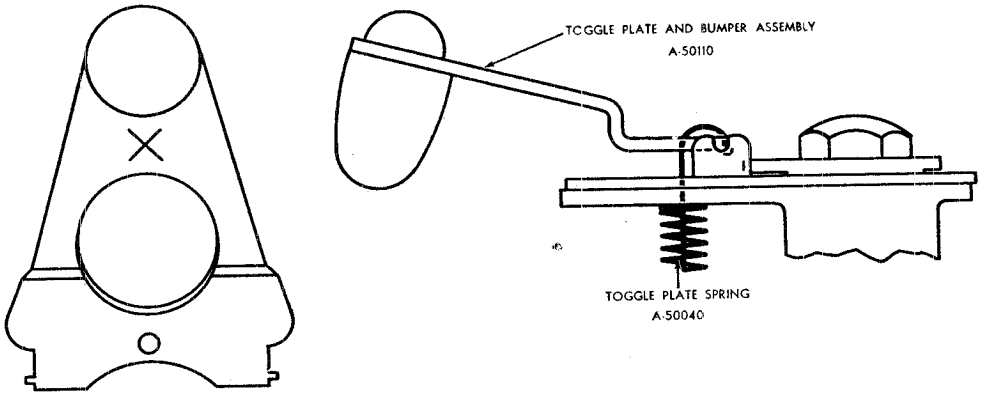
2. Place a 10-inch record over the spindle, allowing it to rest on the spindle ledge and record shelf.

3. Rotate the shelf slightly in either direction to line up the record edge and the shelf. Tighten the set screw.

Note: Be sure the record shelf is in the correct position in relation to the adjustment cam which is under the motor board. When the 10-inch ledge is toward the spindle, the wider section of the adjustment cam should also be toward the spindle.

©John F. Rider

INTERNATIONAL DETROLA CORP.



D—TOGGLE PLATE

The toggle plate is held to the ejector shelf by a spring; this spring also exerts tension on the toggle plate to keep the records in place on the shelf. If too much tension is exerted the spring should be distorted slightly.

The rubber bumper should be assembled to the plate with the large side of the bumper on the side of the plate marked with an "X" or an "O".

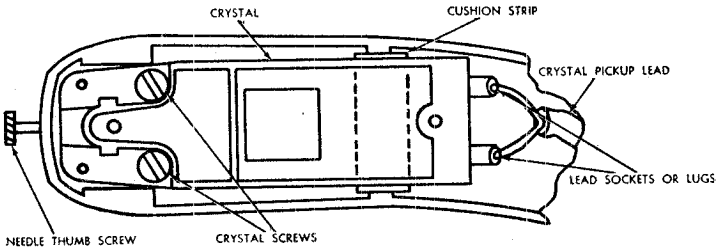
Put the assembly on the ejector shelf, locating the tabs on the plate in the bosses on the shelf. Push the end of the spring through the slot in the shelf with the open end of the spring toward the nut. (The spring will have to compress.) Fasten the end of the spring in the small center hole on the plate. The large side of the bumper is to be placed over the 10-inch records.

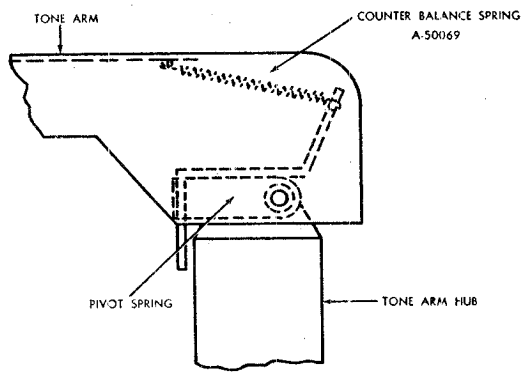
E—THE TONE ARM

The pressure of the tone arm at the needle point should be 1-1/4 ounces. The counter balance spring, which is fastened to the tone arm and to the hub, should be adjusted to secure this tension.

The tone arm may be removed to facilitate changing the crystal cartridge. Simply squeeze the pivot spring and lift off the tone arm. To change the crystal, remove the needle thumb screw and the two screws which hold the crystal to the tone arm. Slip the lead sockets off the plugs on the crystal or unsolder the leads if there are lugs on the crystal. (Caution: Crystals become damaged by excessive heat.) Remove the crystal and replace with a new one in the same manner. Be sure the rubber or plastic cushion strip is placed under the crystal.

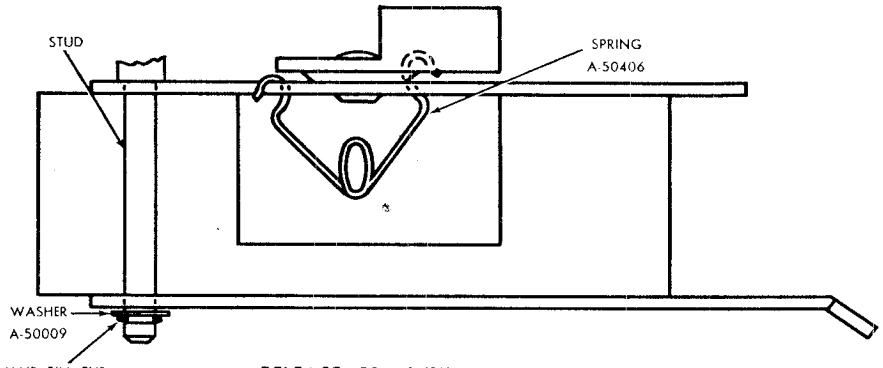
The lead which emerges from the tone arm at the back, should have some slack at all times, or it will bind the tone arm and prevent its free movement across the record.





©John F. Rider

INTERNATIONAL DETROLA CORP.

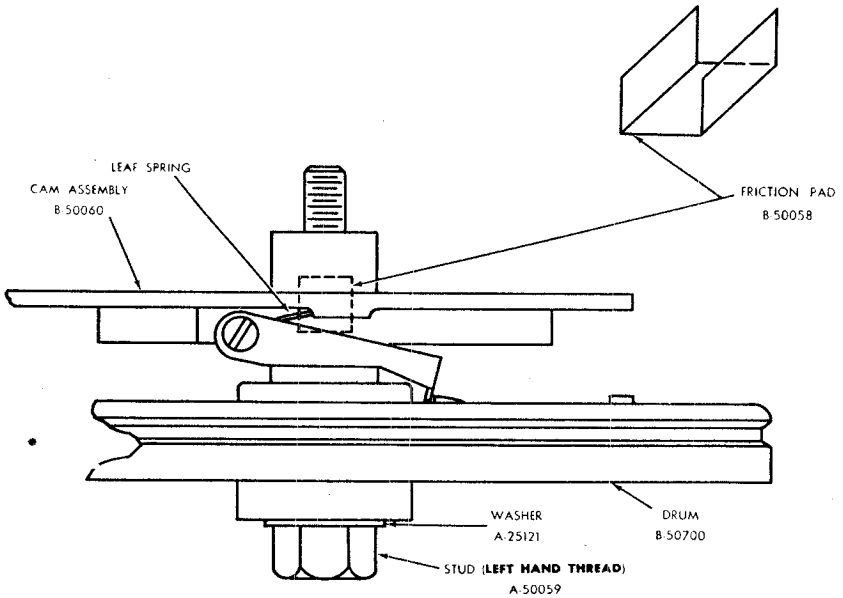


RELEASE BRACKET ASSEMBLY
B-50400

F—RELEASE BRACKET ASSEMBLY

This bracket, with the dog and grasshopper spring assembled to it, is one of the critical items in the unit. It should pivot freely on the stud to which it is assembled. It may be easily removed by slipping the hairpin clip and washer off the stud, and carefully turning the bracket so it will clear the main cam and drum drive wheel.

The dog should pivot very freely. If it does not, clean and relubricate with fine oil. If it is still sluggish, replace the entire assembly.



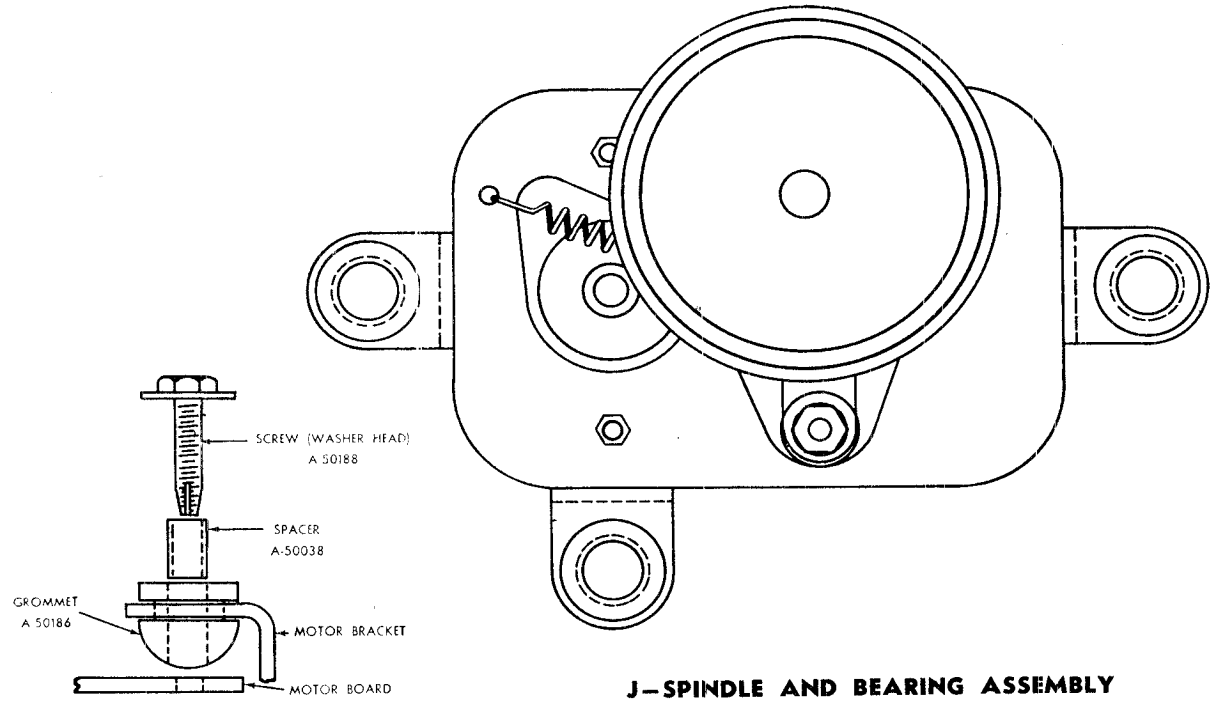
G—CAM AND DRIVE WHEEL ASSEMBLY

This assembly consists of a stud which screws into the main motor board assembly. (NOTE: THIS STUD HAS A LEFT HAND THREAD), a washer, a drive wheel, a main cam and a friction pad. The pad is necessary to provide some drag on the cam for smooth action. It must be assembled carefully so as to prevent deforming. The center holes of the drum and cam are counter sunk for easier assembly of the friction pad.

The drive dog on the cam should pivot freely; the leaf spring exerts a downward pressure on the drive dog into contact with the bosses on the drum. Exerted pressure of the leaf spring should not exceed 2 grams. Deform slightly if required.

©John F. Rider

INTERNATIONAL DETROLA CORP.



MOTOR MOUNTING DETAIL

J—SPINDLE AND BEARING ASSEMBLY

This should always be replaced as an assembly, as it is a precision assembly carefully put together at the factory. See Paragraph C for adjustment after assembly.

H—MOTOR

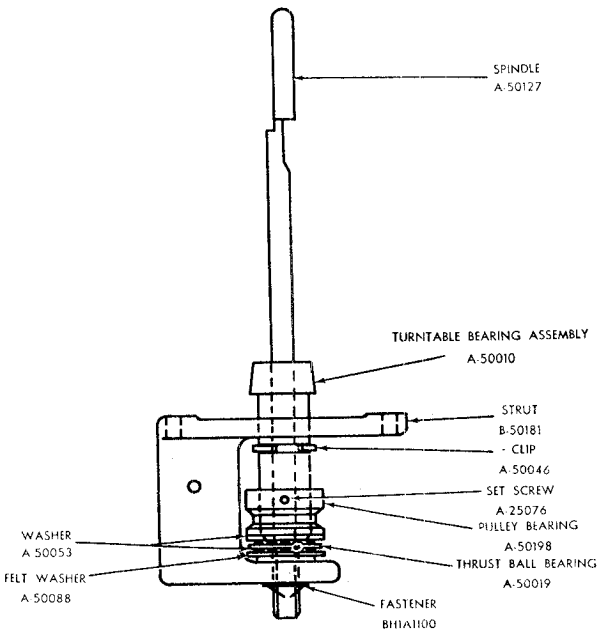
The speed of the turntable should be within the limits of 76 to 81 R.P.M.

If the changer runs slow, and after careful examination there is no evidence of binding of any mechanical parts, the motor should be checked. (Low line voltage should also be considered.)

It is better to order a new motor if it should prove defective. Replacement of pulleys, or rewinding of coils is never very satisfactory.

After a new motor has been assembled to the motor board with its screws, washers, spacers and grommets, and wired to the switch and line cord, be sure to fasten the index spring over one of the mounting screws. Attach the other end of the spring to the index lever.

Caution: Check for the correct relationship of the adjustment cam and record shelf when fastening the spring. In the 10-inch position, the larger side of the cam should be toward the spindle.



(HALF SIZE)

©John F. Rider

TROUBLE SYMPTOMS and ADJUSTMENTS

SYMPTOM	ADJUSTMENT
(a) Changer fails to trip at end of record.	(a) See Adjustment F, Lubrication on tone arm bearing may be gummy. Clean and relubricate. Tone arm may be in "H" detent. Put in proper "A" detent. Tone arm lead may be too tight. Pull up to allow some slack.
(b) Changer cycles continuously, i.e., tone arm lifts immediately from record without playing.	(b) See Adjustment F, and G, Spring from release bracket to tab on "On-Off" lever may be missing or loose. Replace. Drive dog on cam may be stuck or stiff. Relubricate, and check leaf spring.
(c) Tone arm drops too far in on record, or misses record.	(c) See Adjustment A, Tone arm may be in "H" detent. Change to "A" detent. Adjustment cam may be out of phase with record shelf. See Adjustment 3,
(d) Tone arm fails to clear top record of stack, or does not set down on first record.	(d) See Adjustment B, Tone arm lift lever may be bent. Straighten carefully.
(e) Record jams between shelf and spindle.	(e) See Adjustment C,
(f) Record fails to drop from shelf.	(f) Toggle plate may not be flipped onto records. This must be done to provide tension on records. See item "g" below.
(g) Unit stalls when ejecting a record.	(g) See Adjustment C, Spring belt may be weak. Replace. Motor torque may be low. Replace motor.
(h) Turntable speed is slow, or not constant.	(h) See Adjustment H, Turntable bearing may be frozen. Clean and relubricate or replace bearing. See Adjustment G,
(j) Action of unit is very jerky during cycle.	(j) Belt damping core may be worn. Replace with new belt. Friction pad in cam and drum assembly may be deformed. Replace.
(k) Tone arm may be loose in detents on hub.	(k) Flat spring for retaining ball in detent in hub may be deformed. Replace the hub assembly.

MODEL ARC-1

MAGUIRE INDUSTRIES INC.
PARTS MUST MOVE FREELY

The following parts must move freely:

a. Slide (53) check friction by removing turntable and turntable hub and relieve pressure produced by springs. Slide should then move freely along top mounting plate (54). If slide binds, clean off any dirt that is present and check that slide or top plate is not bent. Relubricate between slide and top plate, and slide shafts with Houghton's stayput #320 oil. If not available use SAE 30 or 40 motor oil.

b. Automatic stop lever (40) - remove friction washer (41) and see that lever does not bind.

c. Cranks (32 and 39) in support posts (28 and 51) - check that cranks are not bent. Pushers (80 and 77) should be flush with record guides (58 and 68) when machine is out of cycle. Right pusher, crank, and pusher control lever must move freely when slide is ½ way through cycle.

d. Pickup lifting lever (8) - check for binding in bearing.

e. Pickup actuating lever (50) - check for binding in bearing.

f. Pickup return lever (43) - check for binding in bearing.

g. Trip lever must move freely.

h. Dog must fall freely.

i. Idler plate must slide freely, wheel must rotate freely.

j. Turntable hub - be sure cam does not rub slide. If necessary add a shim washer

k. Motor must turn freely.

In cases where levers are controlled by springs remove springs before checking for binding.

CYCLE OF OPERATION

CAUTION: In any adjustment which requires that the turntable be removed, be careful not to strike the trip lever (52) or dog (30), either when removing or replacing turntable.

Remove cover plates (55 and 72) and turntable (74). The Changer can then be rotated manually through a change cycle by pushing Start-Reject knob (F) and rotating the turntable hub (79) clockwise by hand.

NOTE: Alphabetical references are to figure 1, numerical to figure 5.

	FUNCTION	EXPLANATION
OPERATOR	Turn Record Supports to 10″ or 12″ Positions (A or B).	Record support posts (56 and 71) automatically align themselves by means of index springs (23).
	Place Records on Posts (see figures 2 and 3).	Records rest on support shelves (78) in position to be separated.
	Turn the Start-Reject Knob (F).	Pickup arm (E) rises, releasing pressure on switch (11); circuit of turntable motor (21) is closed and motor starts. Tripping link (47) is pushed in and moves dog trip lever (52) permitting dog (30) to fall. Cam on turntable hub (79) pushes dog (30), moving slide (53) forward and engaging gear.
CHANGE CYCLE	Pickup Arm (E) Rises.	Incline on slide (53) rotates pickup lifting lever (8) through stud, raising pickup arm (66 or E).
	Bottom Record Is Separated.	Left hand pusher (80) pushes record off shelf (78) on to spindle shelf (34). Record pushes right hand pusher (77) which moves crank (39), rotating automatic stop lever (40). Right hand pusher (77) pushes record off spindle shelf (34) on to turntable (74).

©John F. Rider

MAGUIRE INDUSTRIES INC.

FUNCTION	EXPLANATION
Pickup Arm (65) Moves in.	Pickup actuating lever (50) rotates and latch engages pin on pickup return lever (43). Slide (53) starts back rotating pickup arm (66) to 10" or 12" position.
Pickup Arm Lowers Stylus on to Record.	Pickup return lever (43) moves against index stop lug on index plate (71) to insure correct landing position. Pickup lifting lever (8) rotates counter-clockwise lowering pickup arm; this frees pickup latch (50) allowing arm to feed into music. Pushers (77 and 80) return to original position permitting next record to rest on record shelves (78). Slide (53) moves dog (30) along edge of dog trip lever (52). Dog trip lever (52) raises dog (30) permitting cam on turntable hub (79) to revolve without contacting dog (30).
Pickup Arm Rises at End of Record.	Stylus enters fast spiral at center of record and moves in at rate of 1/8" or more per turntable revolution. Pickup lifting pin (part of 65) moves friction finger (part of 52). Friction finger moves dog trip lever (52). Vertical cam on turntable hub (79) drives trip lever (52) back once per revolution. When the pickup (65) moves in at a rate exceeding 3/32" per revolution, the trip lever will move far enough to allow the dog (30) to fall. Dog (30) drops in path of cam on turntable hub (79). Cam on hub (79) pushes slide (53) into gear. Incline on slide (53) rotates pickup lifting lever (8) by means of stud.
Next Record Drops on to Turntable.	Left hand pusher (80) moves next record on to spindle shelf. Record pushes right hand pusher, which through crank rotates automatic stop lever (40) out of path of pickup actuating lever latch (part of 50). Pickup actuating lever (50) rotates pickup arm outwards. Right hand pusher (77) moves record off spindle shelf.
Automatic Stop.	After last record pickup arm rises as above. Left hand pusher (80) moves out. Absence of record prevents actuation of right hand pusher (77). Automatic stop lever (40) remains in path of pickup return lever latch (43). Pickup arm is lowered not on to record but on to Start-Reject. Pickup arm stud (part of (65) opens turntable motor switch (11) shutting off machine.

LOADING: The record changer will play up to ten 12 inch records or twelve 10 inch records. Load as follows:

1. Turn record support posts to 10 or 12 inch position as desired. See figure 1.

2. Place records (any number up to 10-12's or 12-10's) on the small shelves on record support posts, with the turntable shaft through the holes. Make sure all records rest flat on top of shelves.

Do not attempt to force oversize records between record support posts, as machine may jam. Home recordings or other SPECIAL records should not be played automatically as they or the machine may be damaged.

OPERATION: Start the machine by pulling the "Start-Reject" knob towards the front of the machine. Hold knob for a second. The pickup arm will lift, the first record will drop to the turntable, the pickup arm will land near the edge of the record and start to play.

TRIPPING: At the end of a record a fast leadout or eccentric groove will trip the machine automatically, and a change cycle will follow, dropping the next record.

AUTOMATIC STOP: After the last record has played, the pickup arm will land on the "Start-Reject" knob, thus shutting off machine.

REMOVING RECORDS: Turn record support posts one-quarter turn either direction; remove records by lifting straight up from turntable.

MANUAL OPERATION: To play special records (home recordings, etc.) turn record support posts to unloading position, place record on turntable. Lift pickup arm from "Start-Reject" knob, starting turnatble. Place pickup on record.

©John F. Rider

MAGUIRE INDUSTRIES INC.

TROUBLES AND ADJUSTMENTS

RECORD JAMMING CAUSED BY FAULTY RECORD LOADING OR ODD-SIZED RECORD

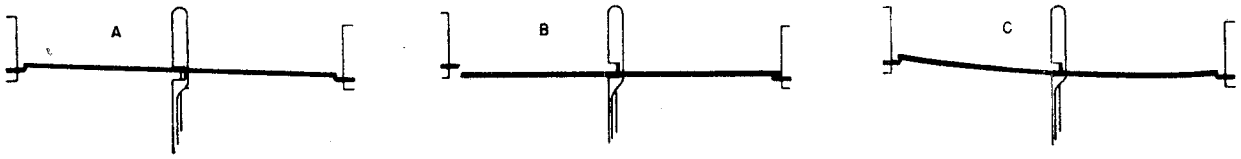

Figure 2

EXPLANATION

a. Correct record loading procedure: record rests on left and right hand support.

b. If records are loaded improperly the machine may jam. When the record rests on spindle and right hand support (78) and not on left hand support (78), as shown in figure, left hand pusher (80) will push second record against right hand guide (68).

c. If record is warped so badly that center hole lies below spindle shelf, record cannot be pushed by left hand pusher (80) and machine will jam.

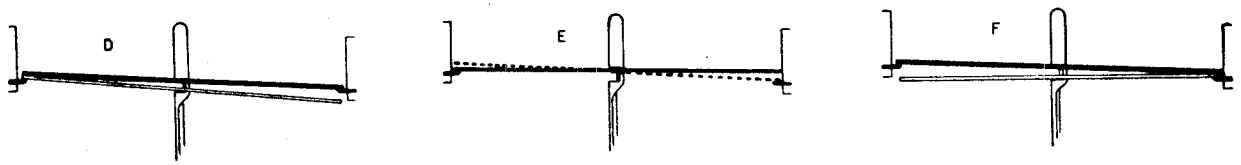

Figure 3

EXPLANATION

d. If record is loaded below right hand support (78) it will not be dropped from spindle shelf.

e. If record is oversized it may not fit between guides (58 and 68) or right hand pusher (77) may not move far enough to allow record to clear left hand shelf (78).

f. If center hole of record is undersized, record will be pinned against spindle. If second record is undersized or if cycle is very slow, second record will drop in front of right hand pusher (77) and machine will jam. This should not occur if cycle speed is more than approximately 40 rpm (normal speed is approximately 80 rpm). Cycle speed is normally 2-4 rpm less than no load speed.

NOTE: Edges of Records badly damaged or highly irregular will also cause jamming.

TROUBLE	CAUSE	REMEDY
Record Jamming Can be Caused by Friction.	1. Friction in right hand pusher (77), plunger (75), etc.	NOTE: Record will not drop from left hand shelf to spindle shelf. When machine is about half way through cycle right hand pusher should move in and out freely. 1. Clean any dirt. 2. Check if crank is bent. 3. Check alignment of record guide. 4. Retaining ring holding crank may be turned. Crank should fit in gap.

©John F. Rider

©John F. Rider

TROUBLE	CAUSE	REMEDY
Failure To Trip (Con't)	5. Record does not have eccentric groove or fast leadout spiral of 1/8" per turn.	1. Use Start-Reject to trip.
Pre-tripping.	1. Friction too great.	1. Relieve friction on friction finger by loosening screw (part of 52).
	2. Spring (38) on trip clutch finger too weak.	1. Adjust spring to six ounces tension. Shorten or replace if necessary.
	3. Trip clutch finger on trip lever should be pushed outward by turntable hub so that there is no play at shoulder with dog.	1. Adjust vertical tab on trip lever.
Continuous Cycling.	1. Tripping link finger (47) bent too far toward trip lever (52).	1. Adjust to proper position.
	2. Pickup actuating lever stop stud may touch trip lever.	1. Bend away.
Pickup Arm Moves Too High or Low in Cycle.	1. Pickup lifting pin (part of 65) bent.	1. Straighten as necessary.
Pickup Latch (part of 50) Fails to Engage Pin in Pickup Return Lever (43).	1. Pickup return lever (43) bent.	1. Straighten as necessary.
	3. Actuating lever (50) not rotated far enough.	1. Twist tail end of slide. 2. Rotate stop lever (40) out of way of pickup latch (50). Actuating lever and pickup return lever (43) when latched should be parallel; there should be minimum of play between these and pickup lifting pin. Twist end of return lever to obtain minimum play.
Sloppy or Indefinite Landing of Pickup Arm.	1. Play between actuating lever (50) and pickup return lever (43).	1. Twist end of return lever. 2. Make sure there is no friction and minimum play between pivot shaft assembly (66) and pickup arm. Adjust pivot screw if necessary.
Incorrect Landing.	1. Lug on record shelf assembly (71) needs adjusting.	1. Bend lugs in or out as required.
Failure to Play More Than One Record.	1. Stop lever (40) not moved properly.	1. Check play between crank (39) and lever. Maximum of 1/16" 2. Right hand pusher (77) not flush with record guide (69) (note: by flush is meant flush to 1/32" maximum back of flush). Bend crank if necessary. 3. See "Pickup Latch Fails to Engage Pin," above.
Failure to Stop After Last Record.	1. Lack of play between crank (39) and stop lever (40).	1. Jars during cycle may move stop lever.
	2. Stop lever (40) bent.	1. Slide does not return stop lever to proper position at end of cycle. Decrease stop lever angle by bending.

TROUBLE	CAUSE	REMEDY
Record Jamming Can Be Caused By Friction (Con't)	2. Friction in pusher control (10) or stop lever (40).	1. Clean out any dirt. 2. Check for bent parts.
	3. Record posts or guides out of alignment (56, 71, 58, 68)	1 Align and space record guides (58 and 68) as in figure.  Figure 4 A line of sight can be drawn from center of record guide through spindle to center of opposite record guide when posts and spindle are correctly aligned. NOTE: Make sure notch on spindle is in right place and spindle shelf is at correct height, i.e., record is horizontal when resting on spindle and right shelf.
Slow, Stalling or Failure to Start.	1. On-off motor switch.	1. Disengage idler (18) and lift pickup arm off switch (11). 2. Check wiring to and from switch. 3. Replace switch.
	2. Slippage between idler (18) and turntable (74).	1. When turntable is stopped manually, motor should stop (with power on). If motor does not stop, clean oil from turntable and the idler wheel with carbon tetrachloride.
	3. Idler does not contact turntable firmly.	1. Idler plate (19) should not hit either side of T slot in motor bracket when wheel is touching turntable. Bend motor bracket if necessary.
	4. Turntable bearing stiff.	1. Push idler plate back so tire does not touch turntable. If turntable does not spin freely, lubricate; look for a bent spindle. Make sure hub does not drag on slide.
	5. Idler bearing stiff.	1. Check lubrication.
	6. Motor bearings stiff.	1. Motor bearings are self-aligning type; if motor turns stiffly by hand, tap motor lightly with hammer on side of stator. 2. Lubricate with 3 in 1 oil.
	7. Defective motor coils.	1. Replace motor if motor smokes or smells.
	8. Low voltage.	1. Check voltage; 100 volts satisfactory. 2. If voltage is low turntable can be pushed by hand to help start.
Failure to Trip.	1. Dog sticks.	1. Dog bent, dirt, dog cover out of adjustment.
	2. Friction on friction finger (part of 52) out of adjustment.	1. Adjust screw on trip lever for just enough friction to move assembly as a unit when pushing fan shaped friction finger.
	3. Insufficient friction.	1. Friction spring bent or trip lever (52) bent.
	4. Slide (53) failed to return to out of cycle position after preceding cycle.	1. Check for friction between slide (53) and top plate (54), or pusher control levers (9 and 10) and slide post; or tail on slide binds ridge on top plate. 2. Tampering with springs is a cause of this. Replace springs. 3. Lubricate slide, top plate and slide latch shafts (7) (Houghton's Stayput #320 or SAE 30 motor oil). 4. If stop lever (40) is bent, there may be friction between slide and stop lever. If machine trips automatically but not with reject knob, check finger on tripping link (47).

This Automatic Record Changer is a precision built, gearless, beltless, simple operating mechanism, designed to give you foolproof, trouble free record reproduction with minimum effort by means of a new, exclusively designed, operating mechanism. This machine is built to automatically change and play a maximum of twelve ten inch records or ten twelve inch records, with a minimum of needle and record wear. Will automatically play records of standard R.M.A. size and dimensions. Records not standard or without trip grooving can be played in manual operating position.

Machine designed to operate on 115 volt, 60 cycle alternating current unless otherwise specified on motor.

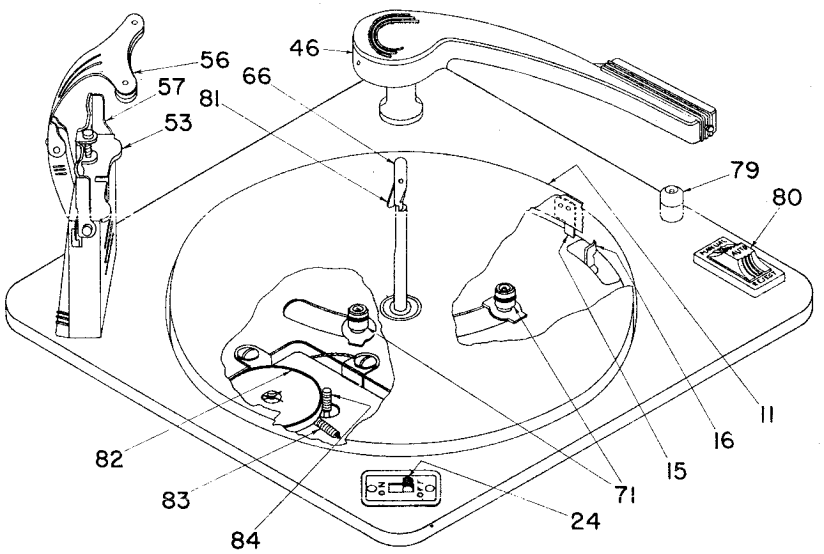

FIG. 1 TOP VIEW

OPERATING INSTRUCTIONS

For transportation and shipping purposes the changer plunger mechanism is locked in cycle or changing position. Push starting switch to "ON" position. If changer turntable does not rotate, push turntable clockwise until turntable rotates by motor power. Your changer now is in permanent operating position. Care must be taken to prevent pickup arm from dropping onto turntable in order to prevent needle from injuring surface of turntable.

Automatic Operation

1. Loading The Changer
   a. Before placing records onto changer be sure pickup arm is placed on pickup arm rest.
   b. If 10 inch records are to be played, lower hinged 10 inch record support to rest horizontally on ejector box. For 12 inch records raise the hinged 10 inch record support into vertical position and rest records on 12 inch record support ears on ejector box.
   c. Place stack not to exceed twelve 10 inch records or ten 12 inch records over center post supported in the center on the center post and at one side on the record support.
   d. Place balance arm to rest on top record, this steadies the records and assures correct dropping of records.
2. Starting The Changer
   a. Push starting switch to "ON" position.
   b. To bring pickup arm into playing position pull reject button into reject position and changer will automatically drop first record and enter playing cycle.
   c. If the machine has been stopped in cycle position and turntable does not rotate after above instructions have been followed, push turntable clockwise until machine returns into normal operating cycle.
3. Rejecting Records
   Records may be rejected any time during playing operation by pulling reject button into reject position.
4. Shutting Off The Changer
   a. Before removing records it is advisable to drop all unplayed records onto turntable by repeatedly pulling reject button into reject position until all unplayed records have dropped onto turntable.
   b. Lift pickup arm and place it on pickup arm rest while turntable and records are rotating. Push starting switch to "OFF" position
   c. Caution. If above procedure is not followed changer will replay last record.
5. Unloading The Changer
   a. Raise balance arm and 10 inch record

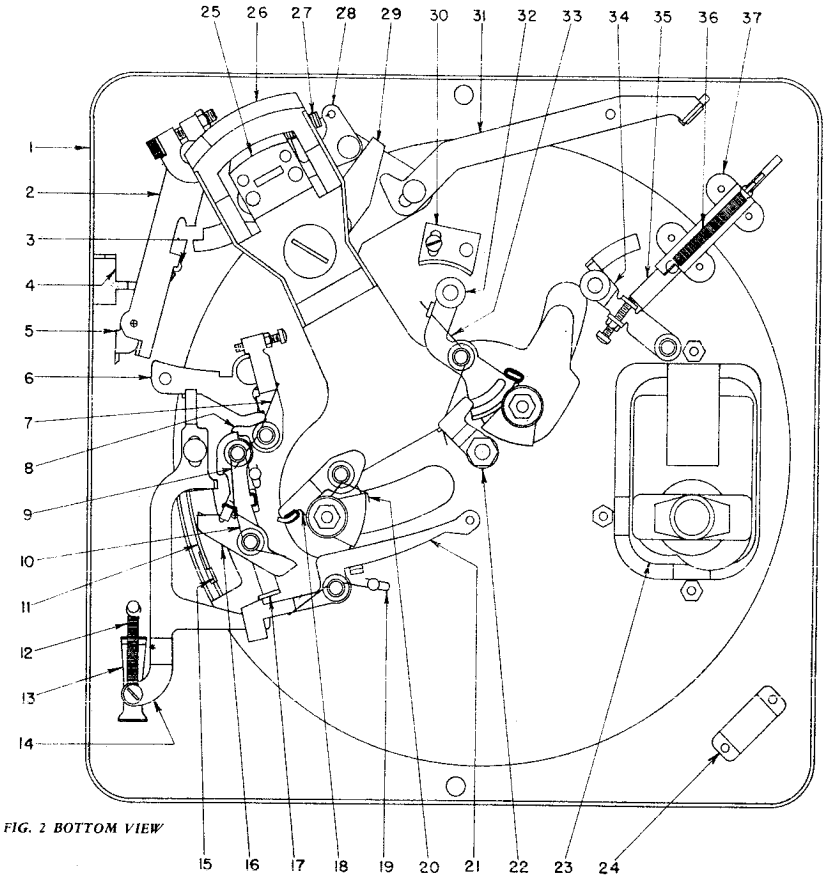

FIG. 2 BOTTOM VIEW

©John F. Rider

support upward to permit easy record removal.

b. Lift played records from turntable.

Manual Operation

1. Raise hinged 10 inch record support into vertical position.
2. Place record over spindle onto the turntable.
3. Push starting switch to "ON" position.
4. Push reject button into manual playing position.
5. Place pickup arm at beginning of record to start playing operation.
6. When through playing place pickup arm on pickup arm rest and push starting switch to "OFF" position.

Cycle of Operation of Correctly Adjusted Mechanism

1. With pickup arm (46) on pickup arm rest (79) and center post dogs (81) and 10" record support down, place stack of 10" records on center post (66) and 10" record support (57) ears. See Fig. (1).
2. Place balance arm (56) on records. See Fig. (1).
3. Push motor switch (24) to "ON" position. See Fig. (1).
4. Pull reject button (80) to reject position and release. See Fig. (1).
   a. Drops 1st record.
   b. Places pickup arm (46) in playing position.
5. Play 1st record.
6. Needle approaches center grooves carrying ratchet arm (2) towards adjusting stop lever (8). See Fig. (2).
7. Contact of ratchet arm (2) and adjusting stop lever (8) disengages jaws of adjusting stop lever (8) & kickoff lever arm (17). (See Fig. (2).
8. Jaws release kickoff lever arm (17) assembly, rotating it into path of kickoff spring (15) which rotates on turntable (11). See Fig. (2).
9. Contact of kickoff spring (15) & kickoff lever (16) rotates kickoff lever arm (17) assembly into locked position with locking lever (21). See Fig. (2).
10. Further movement of turntable (11) causes kickoff lever (16) to disengage dropping lever (18). See Fig. (2).

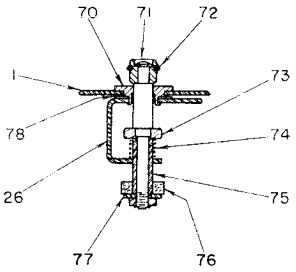

FIG. 3 LEAD OR RETURN DROPPING ROLLERS

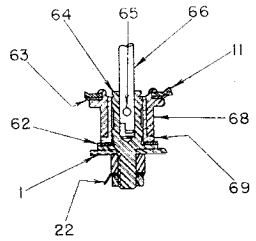
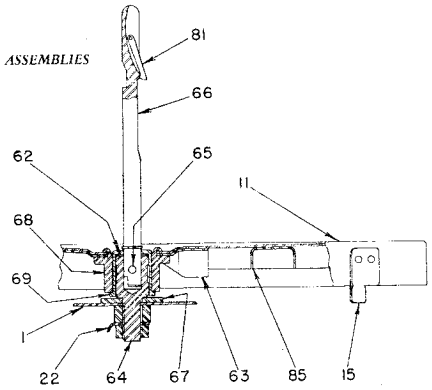
11. Lead roller assembly Fig. (3) drops into turntable spiral (85). See Fig. (4).
12. Disengagement of kickoff spring (15) & kickoff lever (16) rotates kickoff lever to original position. See Fig. (2, 5).
13. Swing arm (26) assembly Fig. (2) is driven through first half of cycle by turntable spiral (85). See Fig. (4).
    a. Adjusting plunger pin (50), riding on swing arm (26) cam, elevates pickup arm (46). See Fig. (6).
    b. Assembly in Fig. (7) is set by arm cam (40) so as to position ratchet arm (2) Fig. (9) on return stroke for proper set down of needle.
    c. Ratchet arm friction springs (25) engage ratchet arm (2) rotating pickup arm (46) to clearance position. See Fig. (2).
    d. Ejector idler lever (34) driven by swing arm (26) Fig. (2) actuate recor ejector assembly Fig. (8). Dropping next record from stack.
    e. Swing arm (26) ear, cams locking lever (21) resetting kickoff lever assembly (17). See Fig. (2).
    f. Cammed dropping lever (32) Fig. (2) releases return roller assembly Fig. (3) dropping it into turntable spiral (85) Fig. (4).
    g. Inner spiral cam (63) Fig. (4) raises lead roller assembly Fig. (3) permitting dropping lever (18) to rotate to setting position. See Fig. (2).
14. Swing arm (26) assembly Fig. (2) is driven through second half of cycle by turntable spiral (85) Fig. (4).
    a. Pickup arm (46) is positioned for set down driven by engaged ratchet arm friction springs (25) and ratchet arm (2) and located by interference of ratchet arm lever (29). See Fig. (2, 9)
    b. Record ejector assembly Fig. (8) is reset to original position.
    c. Swing arm (26) ear releases locking lever (21) allowing it to assume original position. See Fig. (2).
    d. Operation of brake spring (22) prevents acceleration of swing arm (26) at completion of cycle. Gentle set down of pickup arm (46) is so effected. See Fig. (2).

FIG. 4 CENTER POST AND TURNTABLE ASSEMBLIES



ORIGINAL DESIGN



IMPROVED DESIGN

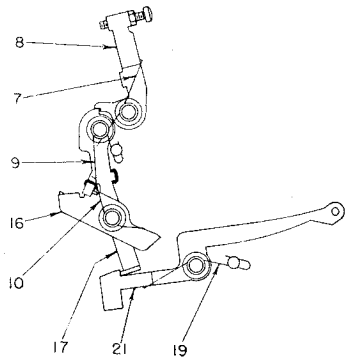


FIG. 5 TRIPPING LEVERS IN LOCKED POSITION

    e. Adjusting plunger pin (50) riding on swing arm (26) cam causes pickup arm (46) to descend to playing position. See Fig. (6).
    f. Assembly in Fig. (7) is released by arm cam (40) resetting ratchet arm lever (29) in clearance position as shown in Fig. (2).
    g. Inner spiral cam (63) Fig. (4) raises return roller assembly Fig. (3). Rotation of cammed dropping lever (32) Fig. (2) provides clearance between inner spiral cam and return roller assembly. This completes the change cycle.
15. Tripping of mechanism by eccentric grooves in center of record.
    a. As record is being played ratchet dog (5) and ratchet lever (6) make contact. See Fig. (2).
    b. Eccentric grooves in record produce oscillation of ratchet arm (2) and ratchet dog (5). See Fig. (2).
    c. Oscillation of ratchet dog (5) across ratchet lever (6) lengthens ratchet arm (2) assembly, rotating ratchet lever (6). See Fig. (2).
    d. Rotating ratchet lever (6), rotates adjusting stop lever (8) disengaging jaws of adjusting stop lever (8) and kickoff lever arm (17). See Fig. (2).
16. For remainder of cycle see parts 8 through 14 above.

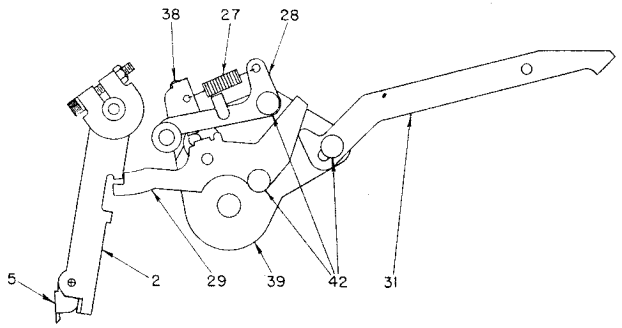

FIG. 9 POSITIONS OF LEVERS FOR NEEDLE SETDOWN

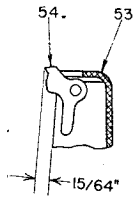

FIG. 10 FINGER TRAVEL OUT OF EJECTOR BOX

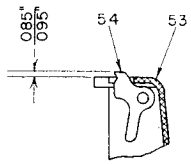

FIG. 11 FINGER TRAVEL ABOVE EJECTOR BOX

ADJUSTMENTS & PROCEDURES

1. Check power supply to motor. Motor operates at 115 volts 60 cycle alternating current unless otherwise specified on motor.
2. Remove turntable (11), move motor idler pulley (82) away from motor shaft (84) and check for motor performance Fig. (1).
3. Check for freedom of motion of motor idler pulley (82) and motor spring (83) tension on same. Fig. (1).
4. Check for grease or foreign matter on motor idler pulley (82) or turntable (11) rim which may cause slippage. Fig. (1).
5. Check for worn motor idler pulley (82) tire. Fig. (1).
6. Check for grease or foreign matter in bearing for turntable collar (62) and mechanism plate center stud (64). Fig. (4).
7. Check for absence of adjusting plunger pin (50). Fig. (6).
8. Adjusting plunger pin (50) incorrect length. Place pickup arm (46) in upright position and remove adjusting plunger pin (50) with acorn nut. Adjust overall length of pin assembly to give approximately ¼" clearance between top of pickup arm and bottom record of stack of unplayed records when unit is in change cycle. Fig. (6).
9. Trip mechanism and rotate turntable (11) by hand until swing arm (26) completes half of its cycle. Loosen screw in cam trip bracket (30) and rotate bracket until there is .012" to .014" clearance between leading edge of cam dropping lever (32) all in Fig. (2) and bearing pin shoulder nut (73) Fig. (3) of dropping roller. Return swing arm to original position. Retighten screw. Recheck this setting by tripping mechanism and rotating turntable by hand observing whether return roller assembly Fig. (3) enters turntable spiral (85) Fig. (4) at formed flat on turntable spiral at completion of half of swing arm cycle.
10. Back up turntable (11) turning it counter clockwise slightly and remove turntable. Push both rollers (71) of swing arm (26) down and push rollers (71) towards reject button (80) to the end of their travel. Replace turntable and rotate by hand for at least one revolution. Fig. (1).
11. Check drop lever torsion spring (20) and cammed dropping lever torsion spring (33) for adequate tension. Fig. (2).
12. Check for worn or frayed rubber on dropping lever (18), replace if necessary. Grease rubber sleeve after installation. Fig. (2). This sleeve, above (73) Fig. 3, may be eliminated entirely for better operation.
13. Check for defective ratchet arm friction springs (25). Fig. (2). If found to be loose or weak, return changer to factory for adjustment.
14. Check ratchet arm (2) for tight engagement with pickup arm swing post (47). Fig. (2,6).
15. Trip mechanism and rotate turntable (11) by hand until swing arm (26) completes half of its cycle. Loosen lock nut on ejector idler lever (34) Fig. (2). Adjust screw until finger (54) protrudes outside of ejector box (53) 15/64". See Fig. (10). Tighten lock nut.
16. Check proper height from ejector box (53) ears to maximum rise of finger (54) top is .085" to .095". See Fig. (11). File to give proper dimension.
17. Check 10" record support (57) Fig. (8) for height differential between ears of 10" record support (57) and top of pusher pin (58). Pin should engage record by .080" to .090". Bend to suit.
18. Put a 10" record on turntable (11), loosen screw on ratchet arm (2) and place pickup needle approximately ⅛" from outside edge of record. Rotate by hand ratchet arm lever (29) and ratchet arm (2) to position shown on Fig. (9) and retighten screw. This setting will automatically set needle down correctly for 12" records also.
19. Move swing arm (26) away from reject button (80) for about 1" of its travel. Check movement of ratchet arm lever (29) which should assume position shown on Fig. (7 or 9) when 10" record support (57) is in down position. Hampered movement may be caused by defective ratchet arm extension spring (38) or excess friction.

20. Remove brake spring (22) and inspect for possible fracture. Replace fractured spring, use two springs if necessary. Fig. (2).
21. Check for defective cam lever extension spring (27) and possible excess friction in parts. Fig. (7).
22. Check for adequate freedom of pickup cartridge wire.
23. Pickup arm (46) should weigh 1¼ oz. when scale is applied at set screw. To adjust weight rotate ratchet for pickup arm (45) so to decrease or increase tension on pickup arm balance spring (44). See Fig. (6).
24. Needle may be worn beyond use.
25. Check to see that changer is level.
26. Check freedom of movement of adjusting stop lever (8) Fig. (2 or 5).
27. Check for presence of all springs See Fig. (2).
28. Tripping levers may assume position shown in Fig. (5). Reset levers by pulling reject button (80). If occurance is frequent observe for extreme wear of nib at point where kickoff spring (15) contacts kickoff lever (16). Fig. (2). Replace kickoff lever arm (17) assembly, and remove 1/32" of mechanism plate (1) increasing size of hole which limits outward travel of kickoff lever arm (17). Remove material from farthest edge from center post (66) allowing greater movement of kickoff lever arm (17) assembly.
29. Set pickup needle at a point 1⅞" from center of record, loosen lock nut and turn screw on adjusting stop lever (8) Fig. (2) until kickoff lever arm (17) releases allowing 1/64" clearance between jaws of adjusting stop lever (8) and kickoff lever arm (17). See Fig. (12). Tighten lock nut.
30. Check for distorted or fractured kickoff spring (15) Fig. (4).
31. Records not manufactured under R.M.A. specifications may not trip changer.
32. Bend the ear on the adjusting stop lever (8) slightly towards heel of ratchet lever (6), to produce increased interference of ratchet dog (5) and teeth of ratchet lever (6). Fig. (2).

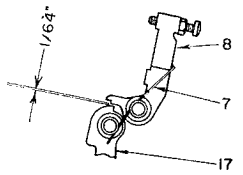

FIG. 12 ADJUSTMENT FOR TRIPPING

33. Apply force with pliers to bend ratchet arm stop bracket (4) away from reject button (80), until pickup arm (46) will rotate to a position allowing 12" record to drop without interference. Fig. (2).
34. Check cabinet cutout for adequate clearance of ratchet arm (2). Fig. (2).
35. Check for worn roller tires (72). Fig. (3).
36. Remove friction spring washer (62) and replace with .010" friction spring washer (62) or eliminate if necessary. Fig. (4).
37. With starting switch (24) "OFF", trip mechanism and rotate turntable (11) by hand. Check that lead roller assembly and return roller assembly Fig. (3) drops into turntable spiral (85) Fig. (4) without touching flange of turntable spiral. Check for foreign matter which would prevent roller assembly from dropping full extent of travel.
38. Lubricate bearing for turntable collar (69). Fig. (4). Use very light machine oil, 3 in 1 or equivalent.
39. Check for foreign matter between turntable (11) and mechanism plate (1). Fig. (1).
40. Defective records.
41. Defective cartridge and amplifier circuit.

Instructions

When ordering parts for Model #10700 Record Changer, specify changer serial number, item number, part number, and description. When ordering motor parts be sure to specify the motor number stamped on each motor. Order special rivets from respective part numbers.

Item No.	Description	Part Number
1.	Mechanism Plate	10701
2.	Ratchet Arm	10759
3.	Ratchet Extension Spring	10761
4.	Ratchet Arm Stop Bracket	10843
5.	Ratchet Dog	10760
6.	Ratchet Lever	10777

Servicing Procedure

1. The following procedure, when followed, will provide the service man with a method of repair which will save him much unnecessary time and effort. Start servicing the changer by performing adjustment #10. This will assure the service man that the changer is in the correct position for proper operation.

2. With pickup arm (46) on pickup arm rest (79) and center post dogs (81) down, place stack of 12 new 10″ records on center post (66) and 10″ record support (5() ears. See Fig. (1).
3. Push starting switch (24) to "ON" position. See Fig. (1).

4. Pull reject button (80) Fig. (1) to reject position and release, observing changer action for any of following possible difficulties. Difficulties encountered may be corrected by following the respective procedure and adjustments indicated.

Procedure & Adjustments	
a. Turntable does not rotate.	#1,2,3,4,5,6
b. Pickup arm does not rise.	#7,8
c. Pickup arm rises but does not rotate into playing position and remains suspended in air. Turntable continues to turn. Click heard on each revolution.	#9
d. Pickup arm rises but does not rotate into playing position and remains suspended in air. Turntable comes to a dead stop cannot be turned by hand.	#10,9,11,12
e. Pickup arm rises but does not rotate into playing position, then sets to rest on pickup arm rest.	#13,14
f. Bottom record does not drop off of supporting ears of 10″ record support (57) and center post (66) Fig. (1).	#15,16,17
g. Pickup arm hits bottom record of not played records.	#8
h. Needle does not set down correctly for 10″ or 12″ records.	#18,19
i. Pickup arm drops fast when setting needle on record.	#20
j. Pickup arm needle does not track in groove.	#21,22,23,24,25
k. Pickup arm needle jumps out of recording grooves and doesn't trip mechanism.	#22,23,24,25,26
l. Mechanism does not trip at end of record.	#26,27,28,29,30,31
m. Eccentric groove on 10″ records does not trip mechanism.	#31,32
n. Changer does not play entire record.	#29
o. Pickup arm does not lift high enough to clear stack of 12-10″ records on turntable.	#8

5. With pickup arm (46) on pickup arm rest (79) and center post dogs (81) down, place stock of 10 new 12″ records on center post (66) and 12″ record support ears of ejector box (53). Fig. (1).

6. Push starting switch (24) to "ON" position. See Fig. (1).

7. Pull reject button (80) Fig. (1) to reject position and release, observing changer action for any of following possible difficulties.

a. Bottom record does not drop off of supporting ears of ejector box (53) and center post (66).	#15,16
b. 12″ record hits pickup arm when record drops to playing position.	#33,34
c. Eccentric groove on 12″ records does not trip mechanism.	#31,32

8. Play any record. Observe and listen for noises which not not seriously hamper operation of changer but detract from performance of changer.

a. Click is encountered on each revolution of turntable during playing cycle.	#11
b. Apparent growl or scroll noise caused by improper operation of roller (71) Fig. (3) on turntable spiral (85) Fig. (4) during change cycle.	#8,12,35,36,37
c. Extreme variation of turntable speed.	#3,4,5,6,38,39

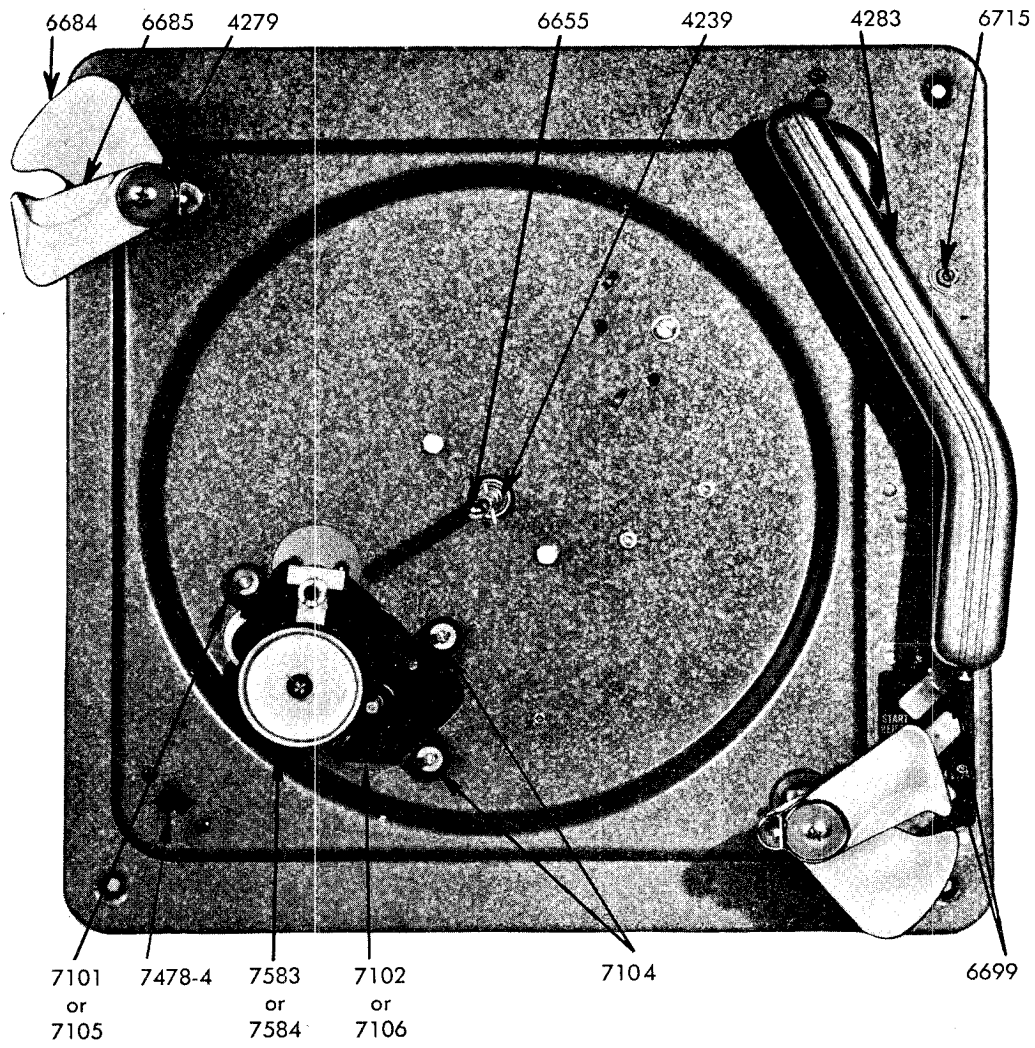
OAK MFG. CO.



TOP VIEW, COMPLETE CHANGER, TURNTABLE REMOVED.

This changer automatically plays ten 12″ records or twelve 10″ records. Service information contained in this bulletin covers the operation, care, and adjustments that may be necessary if the mechanism fails to operate properly.

OPERATION

The motor shaft presses against its idler wheel which turns the turnable (7103 or 7107) from the inside rim. The turntable rests on a pin through the turntable shaft 6655 and causes the turntable shaft to turn. The pinion 4246 at the base of the turntable shaft turns in a notch in the drive cam 4207 while records are playing. When the pickup arm 4283 reaches the inside groove of a record the bracket 6697 on the pickup crank 6694 presses against the trip screw 7555 which is mounted in the pawl latch assembly 7809. The opposite end of the pawl latch assembly releases the starting pawl 6643 allowing the starting pawl to engage the pinion. This starts the drive cam 4207 and the change mechanism.

As the cam begins to turn, the lift pin 6876 is forced upward by the raised portion of the cam. This lifts the tone arm off the record. The cam follower 6695 then rides its groove on the cam and swings the tone arm outward. During this outward swing the indexing pin 6862 slides off the index stop 6856 and is pushed upward by the indexing pin spring 4272. While the tone arm is all the way out, the starting pawl 6643 is cocked into position by the bracket 6697 on the pickup crank 6694.

The cam follower swings the tone arm in until the index pin 6862 contacts the index pin stop thus getting the proper needle drop position.

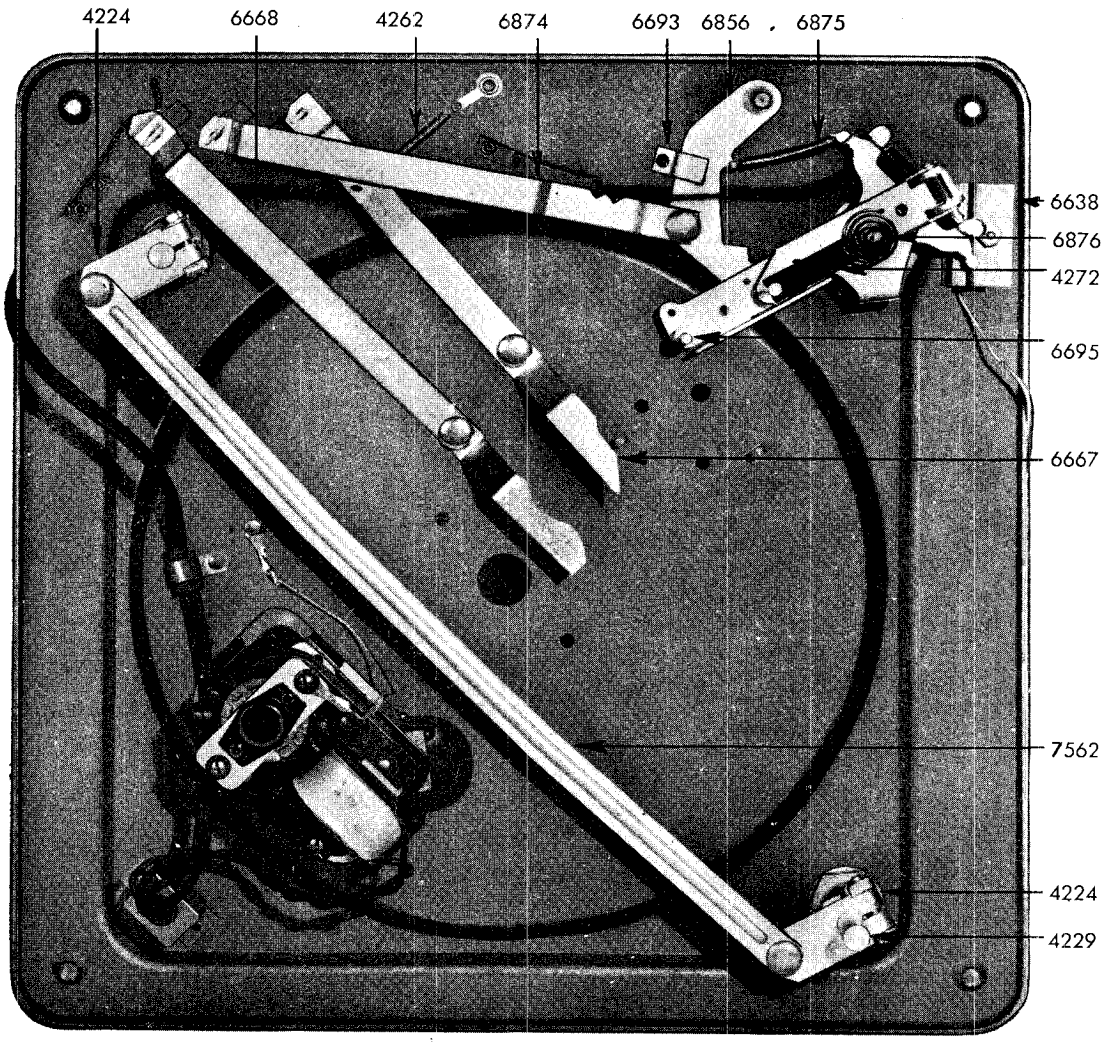
MODEL 6666

OAK MFG. CO.



BOTTOM VIEW, LESS MAIN GEAR ASSEMBLY.

While the cam is turning the eccentric 6645 turns the changer blades thru the action of the eccentric arm 7144 and the tie bar 7562 which connects the changer shafts 4229 and 4232 together.

When the cam again comes to rest it is held in position by the cam stop lever 6659 and cam stop roller 6660.

MANUAL OPERATION

In manual operation the manual link 6668 holds the starting pawl 6643 in the cocked position at all times.

REJECT

The reject link 6667 releases the pawl latch assembly 7309 allowing the starting pawl 6643 to engage the pinion 4246 and start the change cycle.

ADJUSTMENTS

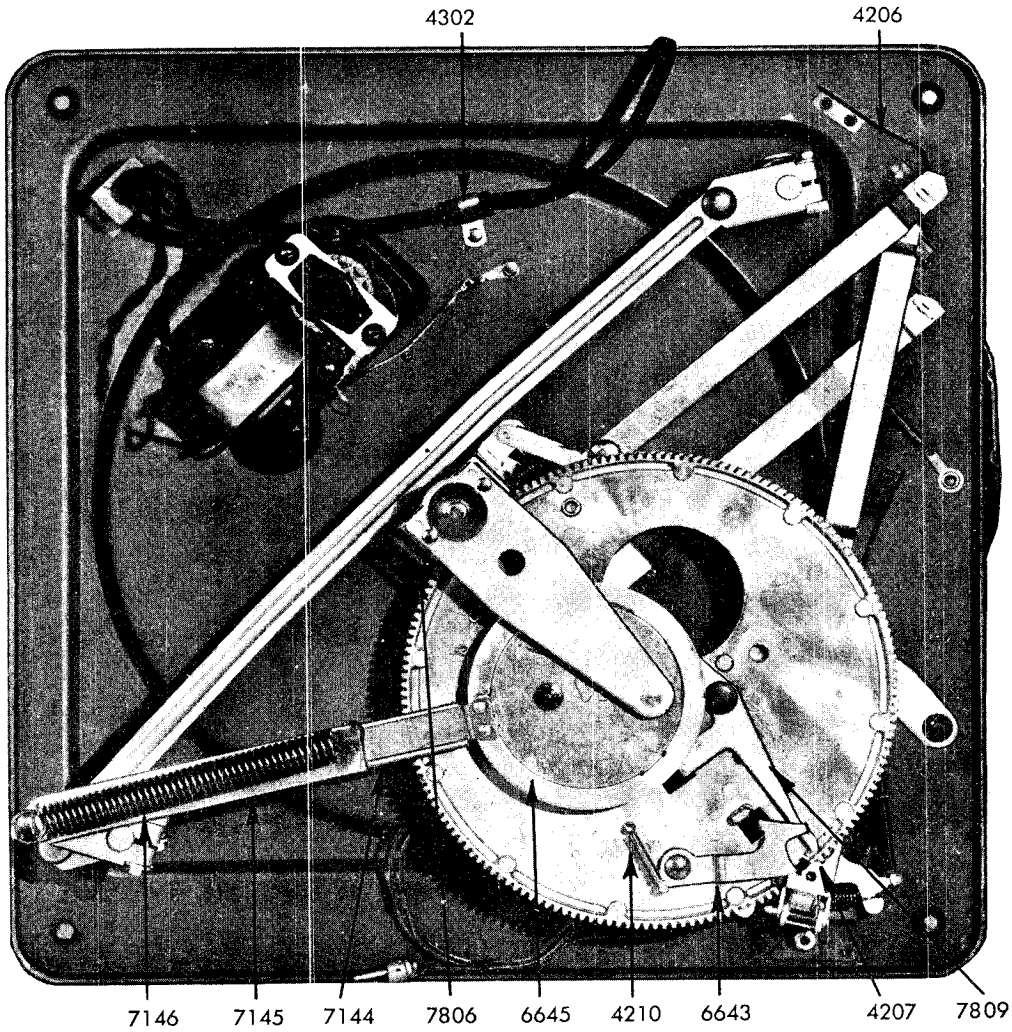
These adjustments are made correctly at the factory and ordinarily need never be altered. Should it become necessary to readjust, due to accident or tampering, proceed as follows:

A. Adjusting The Needle Landing Position

The needle drop adjusting screw 6715 is readily accessible from the top of the changer. To adjust, loosen the nut and turn the screw with a screwdriver. Maximum adjustment is obtained from one complete turn of the screw—any more than one turn merely repeats itself. At the factory the needle drop is adjusted to $4\frac{13}{16}$ inches from center for a ten inch record and $5\frac{13}{16}$ inches from center for a twelve inch record. Both landing positions are governed by

©John F. Rider

OAK MFG. CO.



BOTTOM VIEW, ONE HALF CHANGE CYCLE.

the the same screw so adjusting for one or the other should be sufficient. When completed, tighten locking nut.

If the landing position is out of range for the adjusting screw, the clamp 6858 may have loosened. With the drive cam 4207 in the rest position, move the cam follower 6695 in towards center as far as possible. Then move the tone arm in approximately 1½ inches from center and tighten the clamp 6858. For fine adjustment, readjust the needle drop adjustment screw.

If the tone arm is bent it may require straightening. After straightening, run the changer through a change cycle manually and make sure the tone arm has proper height. (For height adjustment see paragraph B.)

B. Adjusting the Tone Arm Height

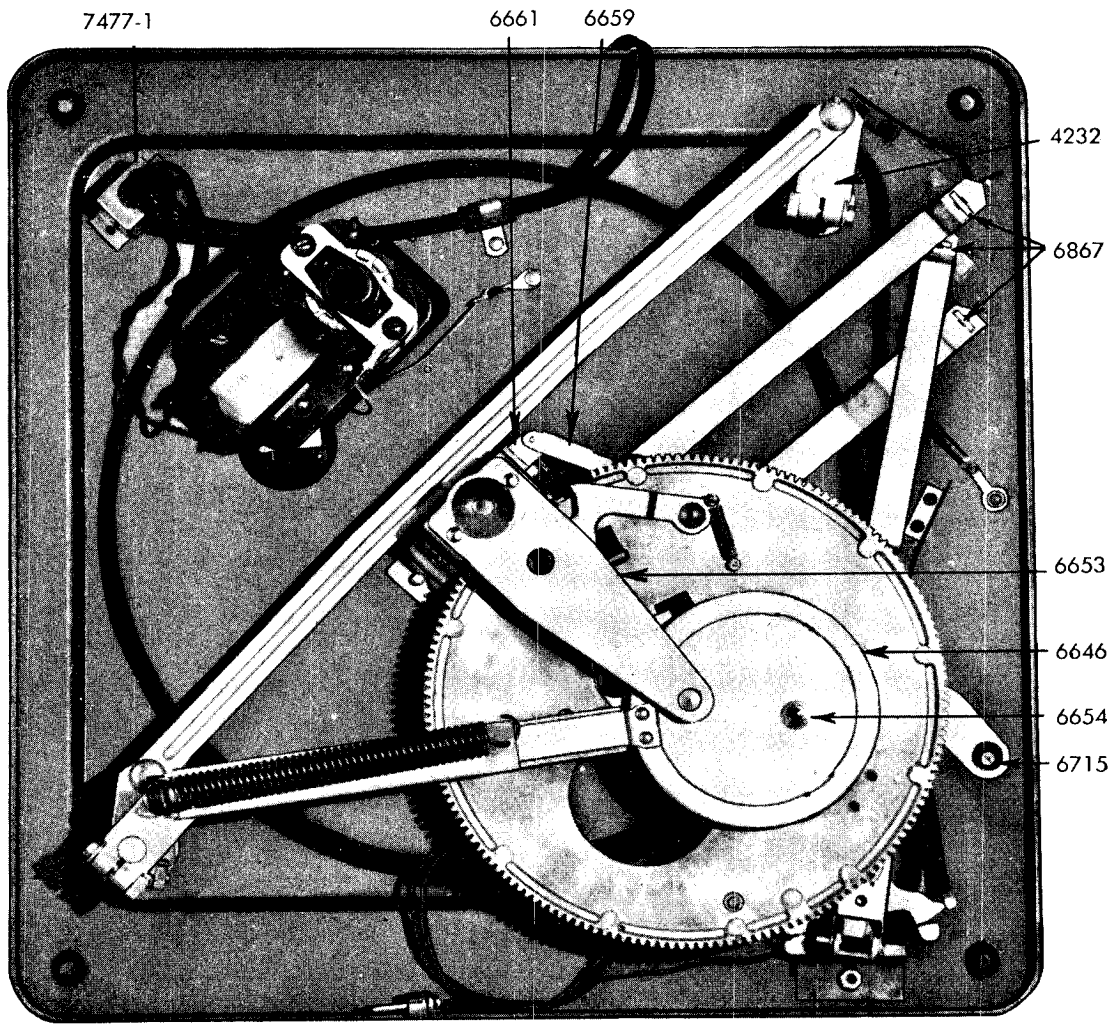
The needle should clear the turntable by 1¼ inches when at maximum height during change cycle. Adjustments can be made by turning the lift adjusting screw 4245. Before the power switch is turned on the changer should be run through its cycle manually to make sure that the tone arm passes underneath the lower change blade and does not jam.

If this adjustment is correct and the tone arm doesn't drop low enough to play the bottom record, inspect the main cam and see that the tone arm lift pin 6876 is all the way down in the hollow on the cam. If not, inspect the cam stop roller 6660 and see that it is in the proper position. Grasping the eccentric arm 7144 and pulling downward may help if the trouble is due to binding.

©John F. Rider

MODEL 6666

OAK MFG. CO.



BOTTOM VIEW, IN OPERATION.

C. Adjusting the Position of Trip

The change mechanism should start when the tone arm is approximately 1 3/16 inches from center. The trip occurs when the tone arm lever presses against the trip screw 7555 on the pawl latch assembly 7809. This screw can be adjusted to change the trip position.

D. Adjusting the Record Drop

Both lower change blades are adjusted to drop a record simultaneously. A loosened driving crank 4224 would allow a record to drop on one side before the other. To reset, turn the turntable manually until the record is just about to drop, loosen the the driving crank 4224 and adjust change blades so they are even. Then tighten clamp.

E. Adjusting Needle Pressure

The needle pressure can be adjusted by turning the pickup spring adjusting washer 4308-1 which changes the pressure of the pickup spring 7818. This adjustment is made for the particular cartridge being used and adjustment may be advisable if a substitute cartridge is used.

TROUBLE SHOOTING

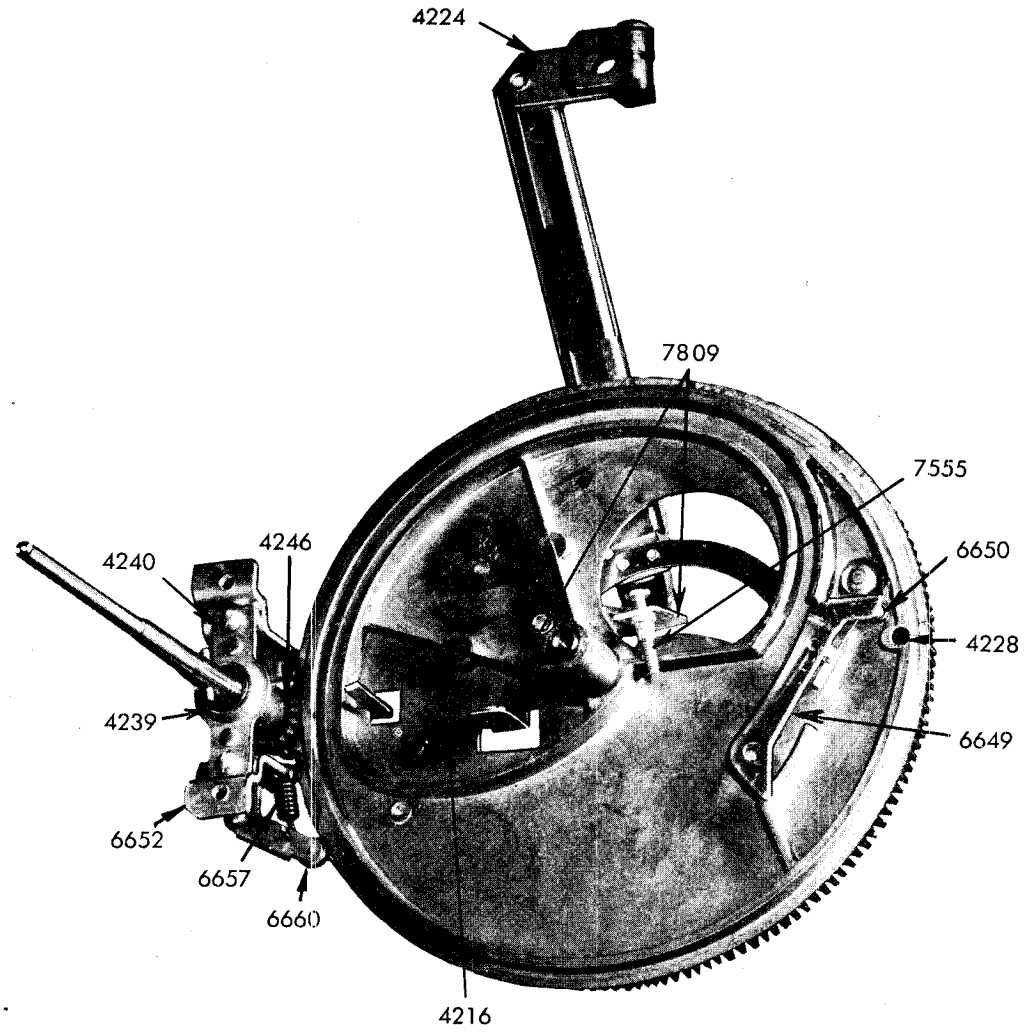
SQUEAKS & NOISES

Squeaks sometimes occur due to friction between the unplayed stack of records and the spindle. This may be eliminated by applying a thin coat of wax or vaseline to the spindle at the point of contact.

Check the oil wick 4228 on the main cam, perhaps it needs oil. If the wick appears dirty or gummy it

©John F. Rider

OAK MFG. CO.



MAIN GEAR ASSEMBLY.

should be removed, thoroughly cleaned, and replaced.

WEAK OR NO OUTPUT

Check the pickup lead from the pickup to the amplifier.

If the amplifier is O.K. replace crystal pickup.

TURNTABLE WILL NOT TURN

No power applied to the changer.
Faulty switch 7478-4.
Burned out motor winding. (See replacing motor.)
Idler wheel spring disconnected.
Foreign material jamming motor armature.

If in change cycle—cam jammed or tie bar 7562 rubbing against the sub frame assembly 7806.

IMPROPER SPEED

Improper voltage or frequency.
Drag on turntable or motor.
Motor or turntable bearings binding.

FAILS TO TRIP

Starting pawl spring disconnected.
Trip screw missing or set improper.
Bent starting pawl or pawl latch.
Dirt binding starting pawl or pawl latch rivets.
Tone arm lever loosened. (See adjustment A.)

The pickup lead wire which emerges from the rear of the tone arm and goes down through the metal base is so placed that it will not hinder the movement of the tone arm. This lead should be free at all times, do not attempt to push excess wire through the base.

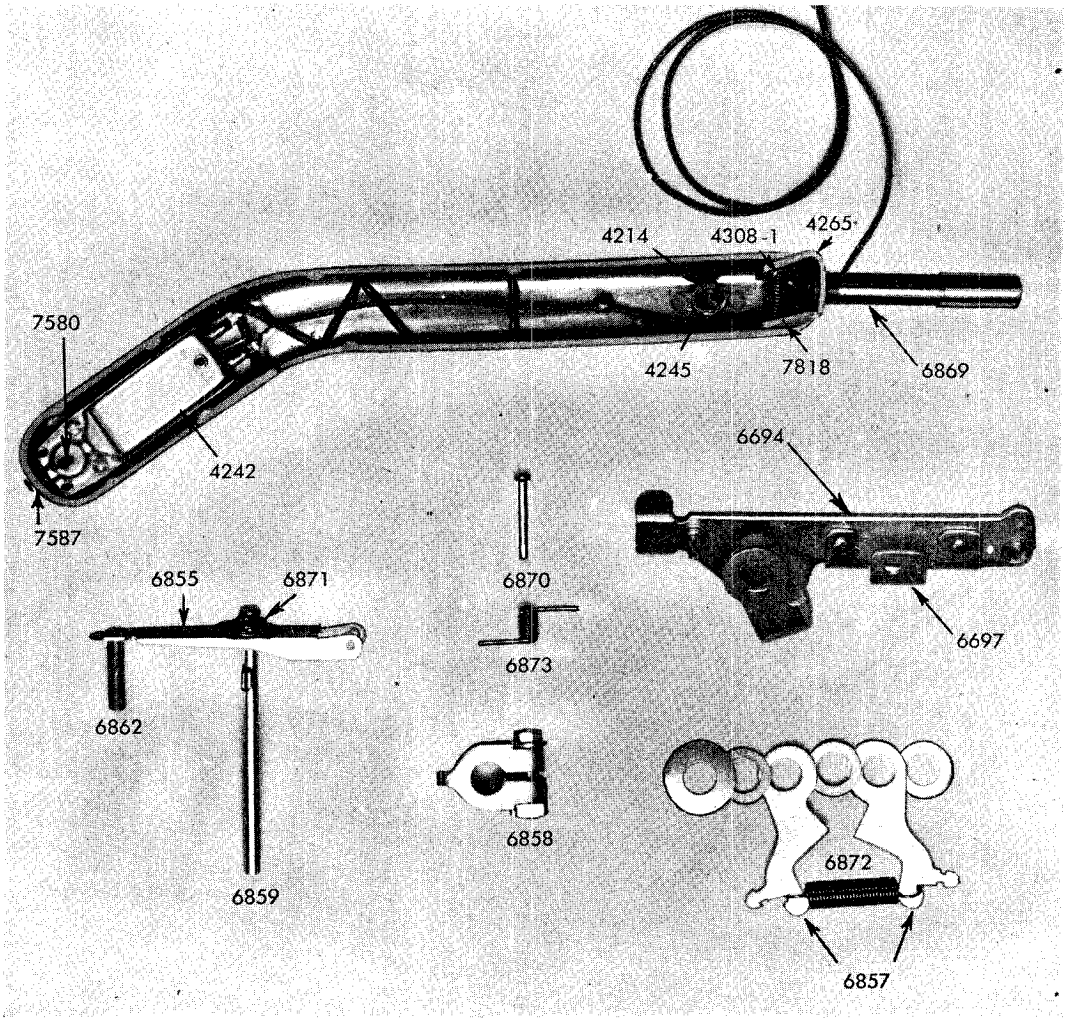
MODEL 6666

OAK MFG. CO.



TONE ARM ASSEMBLY WITH BRACKET, WASHERS, ETC.

CHIPS RECORDS

Warped records are the most common cause for jamming or chipping records. Should the change blades chip flat records they should be bent to have a .06" clearance between them.

RECORDS DROP ON ONE SIDE ONLY

This is most likely due to the driving crank 4224 having loosened. For resetting instructions see Adjustment D.

REPLACING A MOTOR

Remove the turntable by lifting and giving the spindle a sharp tap to release it. Remove the power switch by taking out the two Phillips screws. Remove the switch cover and disconnect the motor wires. Disconnect the motor ground connection, remove motor and replace with a new one.

LUBRICATION

Normally, this mechanism should require no additional lubrication. However, a drop of any good machine oil on the turntable shaft bearings, motor bearings, and frictional surfaces once a year will do no harm.

CAUTION: Do not lubricate the trip mechanism or allow any oil to come in contact with the idler wheel.

PACKARD BELL CO.

AUTOMATIC RECORD CHANGER — RECORDER COMBINATION

GENERAL INFORMATION

LEVELING OF INSTRUMENT

Keeping the record changer-recorder in a level position is of maximum importance. If the floor under the cabinet is not level, shims should be placed under the feet of the cabinet until the base plate of the instrument is level.

Failure to level the instrument may result in improper feed-in of the pick-up arm when the automatic record changer is in use, and during recording, the proper balance of the cutter head would be disturbed.

LUBRICATION

Frequent lubrication of the record changer is not required, however, certain points should receive attention at least two or three times a year. Lubricate with SAE 20 automobile engine oil the following points: Motor bearings (52) and (53), turntable shaft bearing under cam (16) and idler bearing (51) CAUTION: MAKE SURE THAT NO OIL, GREASE, OR SOLVENT GETS ON THE RUBBER TREAD OF IDLER (54). Oil other parts of the mechanism whenever advisable. Keep the working surfaces of cam (16) and the various cams on cam shaft (19) covered with a thin film of petroleum jelly (vaseline).

Whenever the follower arm post (56) shows any tendency to stick or bind in the pivot post bushing (57), apply petroleum jelly to the follower arm post above and below the pivot post bushing. Work the lubricant in by alternately raising and lowering the recording arm (58). Never oil the follower arm post. Work petroleum jelly into the bearing surfaces between the straddle plate (59) and the pivot post bushing (57). This can best be done by raising the recording arm (58) until it is free of the feed screw after which it can be swung from side to side until the lubricant is well worked into place.

It is quite possible that threads or shavings resulting from the recording process will gather on the various components of the instrument. This debris should, of course, be removed. Particular care should be given to cleaning the threads of the feed screw (60). A brush is recommended for this process. At no time use a sharp instrument to clean the threads of the lead screw. Scratches on this component would have a detrimental effect.

AUTOMATIC RECORD CHANGER MECHANISM

ADJUSTMENT OF SPIRAL TRIP MECHANISM

(1) To adjust the spiral trip to operate farther from the center of the record, loosen the set screw (46) holding dog (7) away from the end of the trip rod (45). (Read paragraph 2 before making adjustment).

(2) Dog (7) is set at the factory to trip when the pick-up needle is 1¾" from the edge of the hole in the record center. This standard setting is correct for all late recordings and all but a very few of the older ones. To facilitate the location of dog (7) it is best to hold a scale with the end touching the turntable pin (5) and in such a manner that the pick-up needle will swing directly above the scale graduations. As noted above, the trip should release when the pick-up needle reaches the 1¾" graduation. NOTE: If for any reason the position of the pick-up arm (13) with relation to the pick-up base becomes changed, the trip dog (7) may require resetting. For this reason always make certain the pick-up is being lowered correctly onto the edge of the record before adjusting dog (7). (This pick-up adjustment is covered in paragraph 16).

MECHANISM FAILS TO TRIP

(3) If the mechanism fails to trip always examine the trip grooves on the record first before attempting to make any adjustments. The record grooves may be badly worn or scratched in such a manner as to cause the pick-up needle to jump the grooves. Also examine the pick-up needle for damage.

(4) The trip rod (45) is held in contact with trip latch (24) by the trip rod tension spring (6). If the eccentric trip fails to operate, it may be necessary to increase the pressure of spring (6) against trip rod (45). Before changing this adjustment, make sure the trip rod does not bind in the bearing where it is linked to the pick-up base. Now, make certain the trip rod floats freely. Examine the serration at (11) making certain the sharp edges have not been damaged. Remove any dirt that may be embedded in the serrations that would prevent the trip latch (24) from being engaged. Examine the knife edge of the trip latch (24) to see if it has become damaged. Inspect the spring (6) to see that its long leg clears that part of supporting bracket (36) on which rests trip rod (45). Make sure the

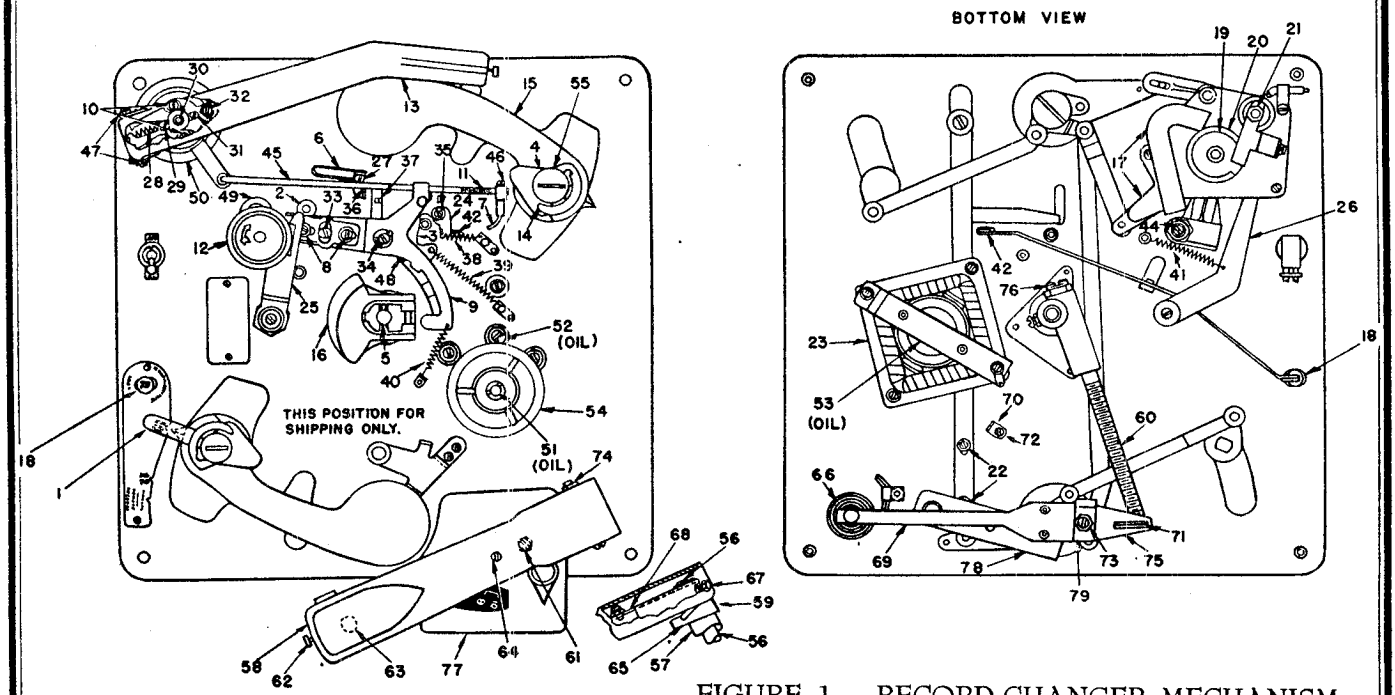

FIGURE 1 --- RECORD-CHANGER MECHANISM

©John F. Rider

MODEL 58004-B

PACKARD BELL CO.

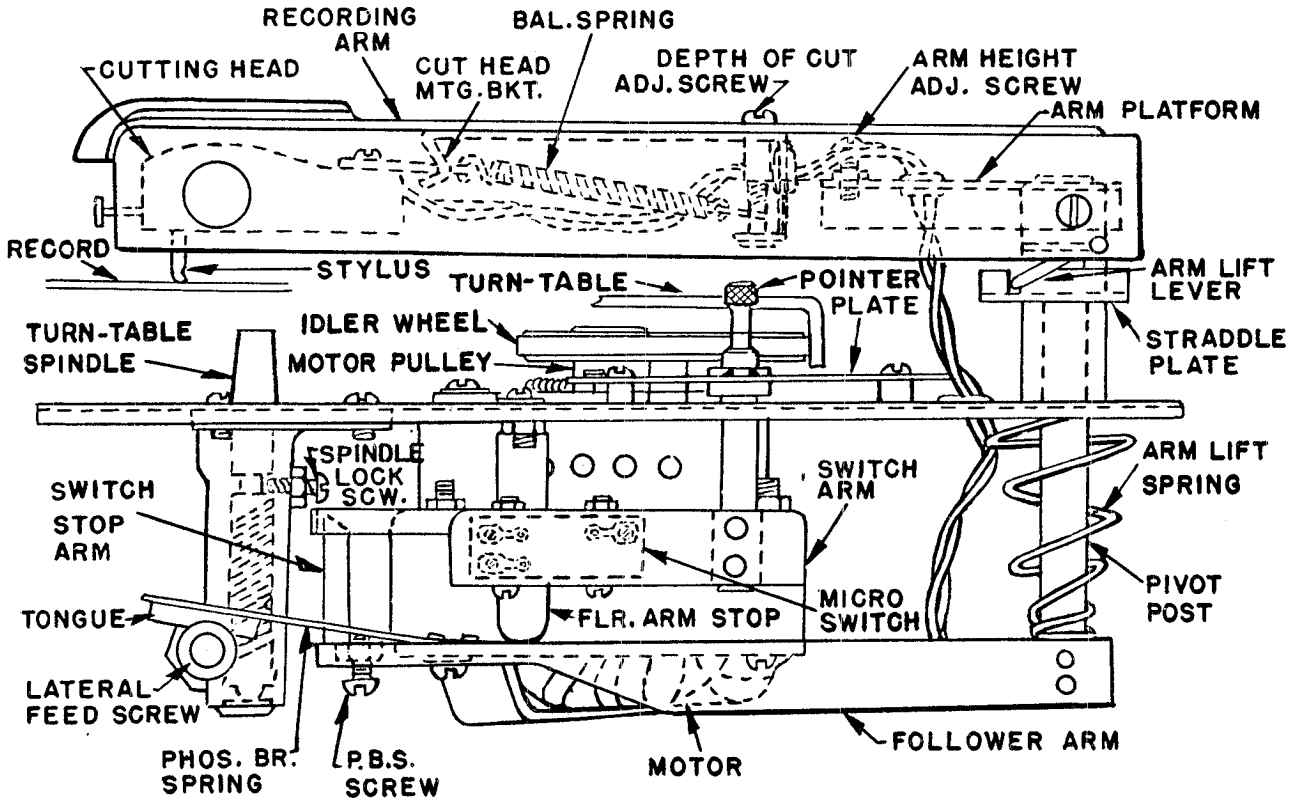

FIGURE 2

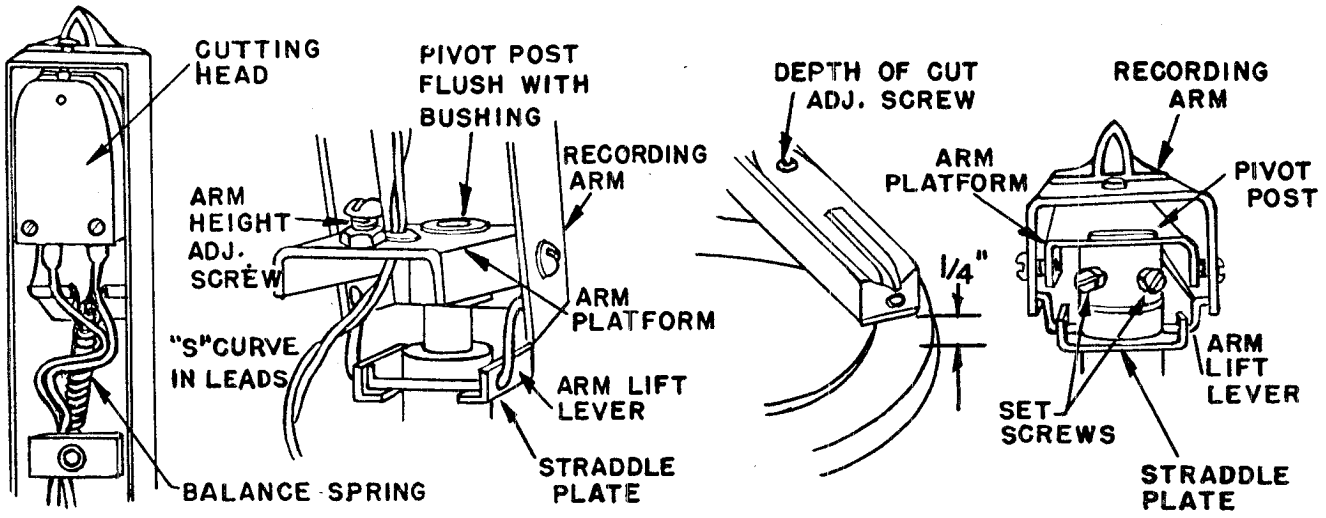
OUTLINE DRAWINGS of RECORDER MECHANISM



©John F. Rider

pick-up needle is not jumping out of the trip grooves on the record. Hold pick-up base firmly with one hand, then press gently sideways on head of pick-up arm (13) to detect any unusual amount of lost motion or play which might be caused by lock screws (10) not holding firmly, or pivot screws (47) not being correctly adjusted. Sight along the length of the trip rod (45) to make sure it is not bent. This would seriously interfere with adjustment of spring (6). If trip rod (45) is found to be bent, always disassemble it before attempting to straighten it. NOTE: Do not increase the pressure of spring (6) against trip rod (45) any more than is necessary to insure operation of the eccentric trip, because excessive spring pressure will cause the pick-up needle to jump the record grooves. To increase the tension of spring (6) against trip rod (45), loosen screw (27) and turn spring bracket (36) in a clockwise direction.

(5) If the pick-up needle shows a tendency to jump grooves on all records and fails to trip, make sure the pick-up arm (13) swings freely. Next check the pressure of the pick-up needle against the record to make sure that counter balance spring (28) is properly adjusted. The needle pressure should be 1½ Oz. To correct insufficient needle pressure, loosen lock nut on adjusting screw (29) and turn adjusting screw (29) in a clockwise direction until needle pressure is correct. CAUTION: Before changing adjusting screw (29) make certain that push rod (30) moves up and down freely and is not supporting the pick-up arm (13) while the needle is apparently resting on the record. Also make sure that pick-up arm (13) is not resting on the head of screw (32). If the pick-up needle only jumps grooves when one record is on the turntable, pick-up arm (13) is almost certainly resting on push rod (30) or screw (32) SEE PARAGRAPH 15. As a final precaution, make sure pivot screws (47) are not too tight; this would interfere with the free vertical motion of pick-up arm (13).

(6) If the trip mechanism still operates in a faulty manner, check the trip latch (24) and the trip cam lever (3) to make sure they are operating freely and do not bind on studs (35) and (48). If either of these levers are scraping on the base plate, make sure the studs have not worked loose.

(7) If lever (3) moves freely when it clears the trip latch (24) but does not swing into the path of the trip cam (16). Spring (39) which connects to lever (3) is either stretched or missing. If lever (3) makes a loud click when it drops in. The rubber bumper, against which it should strike, has worked up and should be pressed back into place.

NOTE: Do not attempt to make the trip mechanism operate from home recorded discs.

CHANGE MECHANISM DRIVE PULLEY FAILS TO ENGAGE

(8) If the trip mechanism functions in a satisfactory manner and pulley (12) is latched in position to engage the turntable rim, but does not contact the turntable rim with sufficient pressure to insure operation, loosen two lock screws (8) and turn eccentric (33) so as to move the pulley control lever extension (49) outwardly a distance which will bring pulley (12) into positive frictional engagement with the turntable rim.

CAUTION: This adjustment is very critical and should be carefully made. If pulley (12) is forced too tightly against turntable rim, the latch (25) will stick at the completion of the change cycle and prevent the pulley from becoming disengaged from the turntable rim. Before making any adjustment it is also advisable to check the set screw in pulley (12) to make sure that pulley (12) is tight and not turning on the shaft which carries it.

(9) If latch (25) fails to hold pulley (12) in position, check the latch to make sure the latch fingers have not been bent. Next, check spring (41) on lever (26) to make sure the spring is not defective or missing. If pulley (12) is riding off the lower edge of the turntable rim or so high as to cause it to scrape against the underside of the turntable, the height of pulley (12) may be adjusted by means of thrust screw (44). Before trying to turn screw (44) always loosen the provided lock nut.

MECHANISM REPEATS

(10) If the mechanism repeats (continues to change records without playing them), the pulley (12) may not be disengaging from the turntable rim. This failure to disengage may be due to the following: Faulty action of the latch (25). (See "Caution" in paragraph 8). A defective or missing return spring (40) on pulley control lever (9). A defective or missing spring (41) on lever (26). Lever (26) may be bent so that it is not contacting the pulley release cam. See paragraph 17).

((1) If pulley (12) disengages at the completion of the change cycle and immediately re-engages, the trip mechanism is at fault and it is suggested that the following be checked: Reject lever (42) may be bearing against trip latch (24) or it might be caught under trip latch (24). Pulley control lever (9) may be bent down so that it engages cam (16) even when cam (16) is not elevated by lift lever (3). Cam (16) may be sticking in the raised position. The re-set spring (38) on trip latch (24) may be defective or missing. The stud (34) on which pulley control lever (9) is mounted may have worked loose and should be tightened.

MECHANISM TRIPS DURING PLAYING CYCLE

(12) If the mechanism trips during the playing of a record and before the pick-up arm has swung inwardly to the point where the trip is adjusted to operate on spiral trip groove records, the following conditions should be checked: Weak or missing re-set spring (38) on latch (24). Defective shoulder on trip latch (24) or rounded corner on cam lift lever (3), permitting lever (3) to slip off the shoulder on trip latch (24). If the mechanism trips when the pick-up is moved by hand to the outside edge of the turntable and beyond, the trip rod (45) may be bent.

MECHANISM TRIPS OR PICK-UP ARM BINDS IN MANUAL POSITION

(13 When lever (1) is moved to the manual position, the pick-up arm (13) should be capable of free motion between the normal limits of its travel without tripping the mechanism. If the pick-up arm binds or trips the mechanism under these conditions check the following: Trip rod (45) may be bent or disengagement finger (37) bent or broken. If rubber bumper (2) becomes pushed up away from the base plate, this will permit lever (9) to overtravel and may jam trip rod (45).

RECORDS FAIL TO DROP PROPERLY FROM RECORD SUPPORTS

(14) If two or more records are dropped at the same time or one edge of the record drops and the other edge does not, then the rear record support (15) may not be correctly adjusted or record separating fingers (14) may be bent. Also check the records to make sure they are of standard diameter or thickness. Should record separating fingers (14) be bent, refer to paragraph 17 for corrective measures. An examination of the unit will disclose that the front record support has fixed positions determined by dedents which are located by lever (1). The rear record support (15) however is adjustable. If the record supports are not the correct distance apart, loosen screws (22) and move the rear record support (15) to the proper position.

CAUTION: Before making this adjustment always make sure the lever (1) is firmly located in the proper dedent.

NOTE: Due to the fact that home recording discs differ from standard records in thickness and diameter, they cannot be handled by the record supports.

PICK-UP ARM LIFT AND REST ADJUSTMENTS

(15) The height to which pick-up arm (13) is lifted during the change cycle may be adjusted by screw (21). In making this adjustment make sure it will not lift high enough to strike bottom record on the record supports. Also make sure that the pick-up needle drops low enough to rest properly on the record on the turntable. If the pick-up arm (13) is in contact with the push rod (30) or the pick-up rest (32) when the pick-up needle is resting on one record on the turntable, the needle will not exert sufficient pressure against the record for proper operation. Before adjusting the pick-up lift the pick-up rest (32) should be checked to see that it is correctly adjusted. Pick-up rest (32) is correctly adjusted when the pick-up needle just touches the top of the turntable. As a final check be sure

©John F. Rider

PACKARD BELL CO.

that the pick-up will track properly when reproducing the thinnest home recorded disc likely to be used.

ADJUSTMENT OF PICK-UP LOWERING POINT

(16) To adjust the pick-up arm (13) so that it will be lowered to the correct point on the outside of the record: First shift lever (1) to the 10" position and then stop the mechanism with the pick-up positioning cam follower at the point of maximum rise of the pick-up positioning cam. Now raise the pick-up arm to the vertical position and loosen two screws (10) so that the arm (13) can be moved with relation to the pick-up base (50). Next holding the pick-up base (50) so that it will not turn, force the pick-up arm (13) toward the record centering pin (5). Now place a scale under the pick-up needle with the end of the scale touching the record centering pin (5). Next, carefully pull the pick-up arm outwardly until the pick-up needle is 4-45/64" from the pin (5). Raise the pick-up arm (13) and tighten the two locking screws (10), being careful not to move arm (13) outwardly past the correct setting before tightening the screws. This adjustment will automatically take care of 12" records as well as 10". This will be seen by moving lever (10) to the 12" position and running the unit through its cycle. If the pick-up arm (13) always lowers in the 12" position, regardless of the position of lever (1), the pick-up positioning cam follower is sticking in the down position. Some pick-ups are equipped with an eccentric (31) for rotating the pick-up arm (13) with relation to the pick-up base (50). On such units the two locking screws (10) are loosened, and eccentric (31) turned a small amount at a time until the pick-up needle is lowered to the correct point on the record.

CHIPPING OF RECORDS

(17) The record supports (4) and the record separating fingers (14) are so designed that no chipping of standard records will take place, unless, through rough handling the fingers (14) become bent. For proper operation the fingers (14) must be perfectly flat. To straighten the fingers (14) it is necessary to remove the large headed screws (55) that hold the fingers in place, after which the fingers (14) can be disassembled. Ordinarily, straightening can be accomplished by holding the main part of finger (14) through which the clamping screw passes with one hand, and then taking hold of the sickle shaped part of (14) with the fingers of the other hand, bending the sickle shaped part until it is lined up with the main body. After bending, lay the finger (14) on a flat surface to make sure the straightening has been properly done.

RECORDER MECHANISM

GENERAL INFORMATION

(18) This model is designed to utilize the "Short Shank" cutting stylus. The overall length of the "Short Shank" stylus is 9/16" to 5/8". Do not attempt to use the "Long Shank" stylus under any circumstances, because it will be found impossible to adjust the "Stylus Angle".

CUTTING HEAD ADJUSTMENTS

(19) The cutter head pressure may be adjusted by screw (64). This adjustment should be made carefully in quarter or half turns. The screw (64) is turned clockwise to increase the cutting depth and counter-clockwise to decrease the cutting depth. The proper cutting pressure is one and one-quarter ounces. To assure that the correct cutting depth has been attained, make a trial cut. The shaving left by the cutting stylus will be continuous and slightly elastic, and its thickness will be about the same as a human hair.

STYLUS ANGLE ADJUSTMENT

(20) The stylus angle is controlled by the length of the stylus and the distance from the top of the recording blank to the recording arm (58). Referring to Figure — it will be noted that this distance is approximately one-quarter inch. This distance may be regulated by raising or lowering stylus angle screw (61). Keep in mind, when making this adjustment, that the stylus must be inserted as far as possible into the stylus chuck.

(21) CAUTION: Because of the wide variation of the thickness of record blanks (.020" to .100"), the variation of the length of cutting stylii (9/16" to 5/8") and the possibility of warped or bent recording blanks, be sure that the stylus clamping screw (62) does not strike the bottom of the slot in the end of the recording arm as the stylus follows the surface of the recording blank.

(22) WARNING: Never allow the stylus to rest on a stationary recording blank if energy is being fed into the cutting head. The stylus will dig through the record coating and damage its cutting edges.

PROPER ENGAGEMENT OF FEED SCREW

(23) Engagement between the knife edge (71) and the feed screw (60) usually starts to take place when the nose of the recording arm is around two inches above the turntable. When the recording arm (58) is raised to a greater height than this, unhampered horizontal motion of the recording arm is possible between the normal limits of its travel. To permit disengagement of the recording arm from the feed screw at a minimum height above the turntable, stop screw (73) has been provided. Adjustment of screw (73) should be made with the recording arm in lowered position and with the feed screw engaged. Adjust screw (73) so that it barely touches spring blade (75) when the knife edge (71) is engaged at any point in the length of feed screw (60).

(24) Normally the full pressure of knife edge (71) against feed screw (60) is desirable. If this pressure is sufficient to cause uneven turntable speed, the pressure of knife edge (71) can be reduced by turning screw (73) in a clockwise direction. Great care should be used in reducing the blade pressure, as uneven groove spacing may result.

UNEVEN SPACING OF RECORD GROOVES

(25) If screw (73) is turned too far in a clockwise direction, it will reduce the pressure of the knife blade (71) against feed screw (60), to where the knife blade (71) will climb the sides of the thread in the feed screw and cause uneven spacing of the recorded grooves. Always be sure that the threads of feed screw (60) are free of dirt or other foreign matter, as these particles will cause uneven spacing of record grooves. Excessive end play in the feed screw will also cause uneven groove spacing.

(26) Thrust screw (76) is provided to keep the end play out of feed screw (60). Care must be used in adjusting screw (76) to prevent binding feed screw (60) between the end thrusts, as this would put an excessive load on the motor and cause speed variations on the turntable.

(27) Lost motion or play between the follower arm (69) and recording arm (58) in the horizontal direction, will prevent the recording arm from accurately following the follower arm. This play should be eliminated.

HOW TO REPLACE CUTTER HEAD

(28)
1. Remove stylus screw (62).
2. With the arm (58) in the vertical position, press the balance spring against the top of the arm which will throw the cutter head out where it can be firmly grasped.
3. Pull the cutter head upwards until the knife edge at the back of cutter clears its seat in the arm.
4. Unhook the balance spring from the cutter head.
5. Hook the balance spring to the new cutter head and extend the spring sufficiently so that the cutter head knife can be placed in its seat in the arm.
6. Replace stylus screw.
7. Thread the cutter leads through the arm and the arm platform. Clamp the leads on the underside of the base plate and arrange them exactly as before.

AUTOMATIC CUTTER STOP FAILS TO OPERATE

(29) The automatic cutter stop (77) is almost completely devoid of parts that are likely to fail. The only part that is at all likely to fail is the micro-switch (78). Since this micro-switch is completely sealed in, it must be replaced in its entirety.

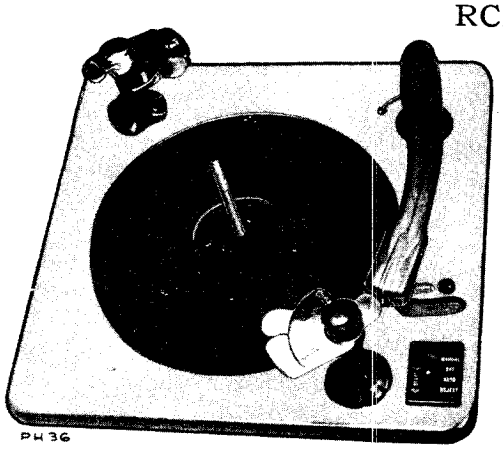
960001-3

RCA MFG. CO.



Model Nos. 960001-1, 960001-2, 960001-3

Automatic Record Changer

SERVICE DATA

—1945 No. 12—

RADIO CORPORATION OF AMERICA
RCA VICTOR DIVISION
CAMDEN, N. J., U. S. A.

Pickup Cartridge Data

Model	Cartridge
960001-1	39851
960001-2	70332
960001-3	39851

96000-2 and 96000-3 have an additional pickup shorting switch which contacts roller on tone arm lever (17) and shorts out pickup while tone arm is in the rest position.

Manual Operation

Old, odd sized and home recording records should be played in "Manual" position.

1. Lift and turn selector arm until selector arms point outward as for unloading records.
2. Place records to be played on turntable and move control knob to "Manual" position.
3. Place pickup on record.
4. When selection is finished playing, return the tone arm to rest position and move control knob to "off" position.

Note: Do not move control knob to "off" position before placing tone arm in rest position, or cycling will result. If this should occur do not handle tone arm. Place control knob in automatic position and allow cycle to continue until tone arm comes to rest before continuing with manual operation.

Cautions

1. Never use force to stop or rotate turntable or any other part of the mechanism.
2. Do not play a chipped or cracked record as damage to sapphire may result.
3. Warped records may slide upon one another while playing and cause unsatisfactory reproduction.
4. Do not attempt to handle tone arm while mechanism is in cycle.
5. Do not allow records to remain on selector arms when not in use, particularly in warm climate.
6. Do not allow oil or grease to come in contact with the rubber tire on drive idler or any other rubber parts.
7. Do not attempt to move the tone arm horizontally when in the rest position, unless control knob is in the manual position.

Lubrication

1. **GREASE**—Gears, all cams on large gear, tapered end of tone arm latch and tone arm lever with LUBRIPLATE #105 (Lubriplate Corp., 3211 South Wood St., Chicago).
2. **OIL**—All shafts before inserting into bearing and all moving parts, except those to be greased, with AIRCRAFT INSTRUMENT AND MACHINE GUN OIL, SPEC. 2-27E (Delta Oil Products, Milwaukee, Wis.).

Note: Keep grease and oil away from rubber parts such as drive idler, bumpers, etc.

Do not oil or grease clutch engagement lever.

Features

1. This record changer is a two post drop type, non-intermixing mechanism designed to play automatically a series of twelve 10-inch or ten 12-inch records of the standard 78 RPM type.
2. The mechanism uses a light weight, low noise, crystal pickup cartridge, equipped with a long life sapphire point.
3. The tone arm is automatically returned to the rest position and the power removed from the drive motor, after the mechanism has finished playing the last selection of the stack.
4. The changer is equipped with an eccentric and closed circle tripping device.
5. A pickup shorting switch is incorporated which shorts out the pickup during record change cycle. This prevents noise from gears, cams and other moving parts from being amplified through the reproducing system.
6. The mechanical linkage between record support posts makes possible a single and simple operation on the part of the operator to change from 10 to 12-inch records or vice versa.
7. The changer can be used on either a 50 or 60 cycle power supply by the use of the proper spring sleeve slipped over the shaft of the drive motor.
8. All gears and cams are disconnected while the records are being played. This removes the load on the motor and eliminates excessive friction and noise from moving parts which otherwise have a tendency to produce wow or rumble.

Automatic Operation

1. Lift and turn the selector arm #1 in the front right-hand corner of the changer panel to a position engaging the slots in the selector sleeve. In so doing the arrows and numbers designating record size should be pointing toward the turntable spindle.
2. Load the records to be played on the separator arms with the desired selections upward and in the proper sequence. The last record should be on top.
3. Move control knob to "reject" position and release it. The changer will play the selections in the entire stack at which time the control knob will return to "off" position automatically.
4. Lift and turn the selector arm to facilitate the removal of records on turntable.

Note: To stop mechanism before the selections in the entire stack have been played, move the control knob to "off" position, remove records on selector arms and lift and move the tone arm to rest position.

©John F. Rider

MODELS 960001-1,960001-2, 960001-3

RCA MFG. CO.

Functions of Main Parts

I. Motor

The function of the motor is to serve as a power source for the changer. Power is transmitted from motor to turntable through the rubber-tired idler wheel.

II. Control slide and associate parts

A. General function is to provide a single knob control for the various operations shown on the escutcheon plate through its interaction with the changer mechanism.

B. The power switch is mechanically operated by the control slide through a linkage to correspond to the various positions on the escutcheon plate.

C. Manual Reject Slide (27), fig. (3)

1. Manual position—With the control slide in the "manual" position the formed end of the reject slide (27) fig. (16) engages the clutch engagement lever (33) and holds it in an up position so that the trip mechanism is inoperative.
2. Reject position—The short formed end of the reject slide (27), near the mid-section, contacts part of trip lever (28) and trips the mechanism.

D. Tone Arm Latch (14), fig. (3)

1. Functions as a positive lock, fig. (12), for the tone arm whenever the latter is moved to the outside of the panel in all positions of the control slide other than "manual".
2. Also functions as a partial lock, fig. (12), or detent, for the tone arm lever (17) while the control slide is in "manual".

E. Manual Lock Out (4), fig. (3)

Function is to engage and retain the tone arm locator (16), fig. (15), in its outermost position while the control slide is set in the "manual" position.

F. 10 and 12-Inch Set Lever (19), fig. (3)

Function is to index the tone arm properly for 10 or 12-inch records, fig. (19).

III. Spindle Housing, Gear Assembly, and Associated Parts

These two main castings are assembled with other component parts into a major sub-assembly, which includes a spindle and pinion. The assembly operates only in a counter-clockwise direction (viewed from bottom side) and provides a clutching and driving action for all automatic operation. Large gear rotates in a clockwise direction (viewed from bottom). One revolution of this large gear carries the mechanism through a complete change cycle.

A. Pinion Gear (37), fig. (5)

1. Operates as part of the clutch.
2. Operates as a gear to drive the main gear through a change cycle.
3. Serves as a vertical stop for the spindle to which it is pinned.

B. Clutch Engagement Lever (33), fig. (5)

1. Function is to engage projection on pinion gear to start change cycle.

C. Trip Lever Assembly (28), fig. (4)

1. Function is to hold the clutch engagement lever (33), fig. (4) in a position such that it clears the pinion gear (37), fig. (5), except when tripping for cycling.

IV. Selector Arm and Blades

1. Function is to support the records and, together with the selector blades, to separate the lowest record of the stack and allow it to drop to the turntable during the change cycle.

V. Tone Arm Lever and Associated Parts

A. Tone Arm Lever (17), fig. (3)

Controls the horizontal movement of the tone arm.

B. Tone Arm Locator Lever (16), fig. (3)

Function is to control the tone arm lever in determining landing position of the pickup, fig. (8).

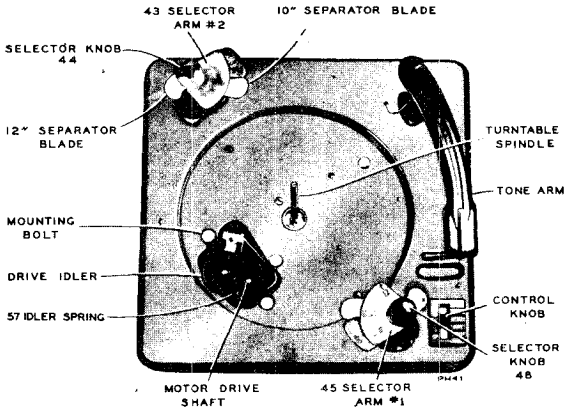


FIG. 1

C. Booster Spring (67), fig. (3)

A small piece of round spring wire which provides a limited amount of spring tension inward, tending to push the pickup into the starting groove.

VI. Tone Arm Lift Pin (51), fig. (24)

Function is to control vertical motion of tone arm.

VII. Selector or Support Arm Gears (35), (36), fig. (3)

Function is to transmit energy from drive mechanism to selector arm and knives.

VIII. Trip Plate (Knurled) (30), fig. (3)

Contacts trip dog (31), fig. (4), for eccentric tripping.

IX. Trip Shoe (29), fig. (3)

Functions as part of the closed circle tripping device.

X. Segments (23), (25) and Tie Plate (24), fig. (3)

Constitute the mechanical linkage between separator arms.

XI. Drive Gear Stop Lever (34), fig. (6)

Functions to stop and position drive gear after cycling.

XII. Tone Arm Retard Lever (26), fig. (4)

Stabilizes horizontal movement of tone arm while in cycle.

Miscellaneous Service Hints

1. Rumble

A. Remove turntable by lifting straight up and inspect the drive mechanism for a defective idler wheel. (Rough rubber tire or very sloppy bearing.)

B. Inspect the mounting of the changer to determine whether or not the mounting clamp nuts have been loosened.

C. Check and replace any microphonic tubes in the reproducing system.

2. "Wow" or Speed Variation

A. Make certain the turntable is free to rotate and not rubbing on motor board or portion of drive mechanism.

B. With the mechanism out of cycle remove the turntable by lifting straight up. The spindle being disengaged from all portions of the drive mechanism should rotate freely when turned by hand.

C. Check for badly worn idler as described in Item (1A).

D. Check for presence of grease on rubber tire of drive idler and the inner rim of the turntable. (Naphtha or carbontetrachloride will remove harmful grease.)

E. Bent turntable spindle.

F. Insufficient tension of drive idler spring (57), fig. (1).

©John F. Rider

RCA MFG. CO.

MODELS 960001-1, 960001-2, 960001-3

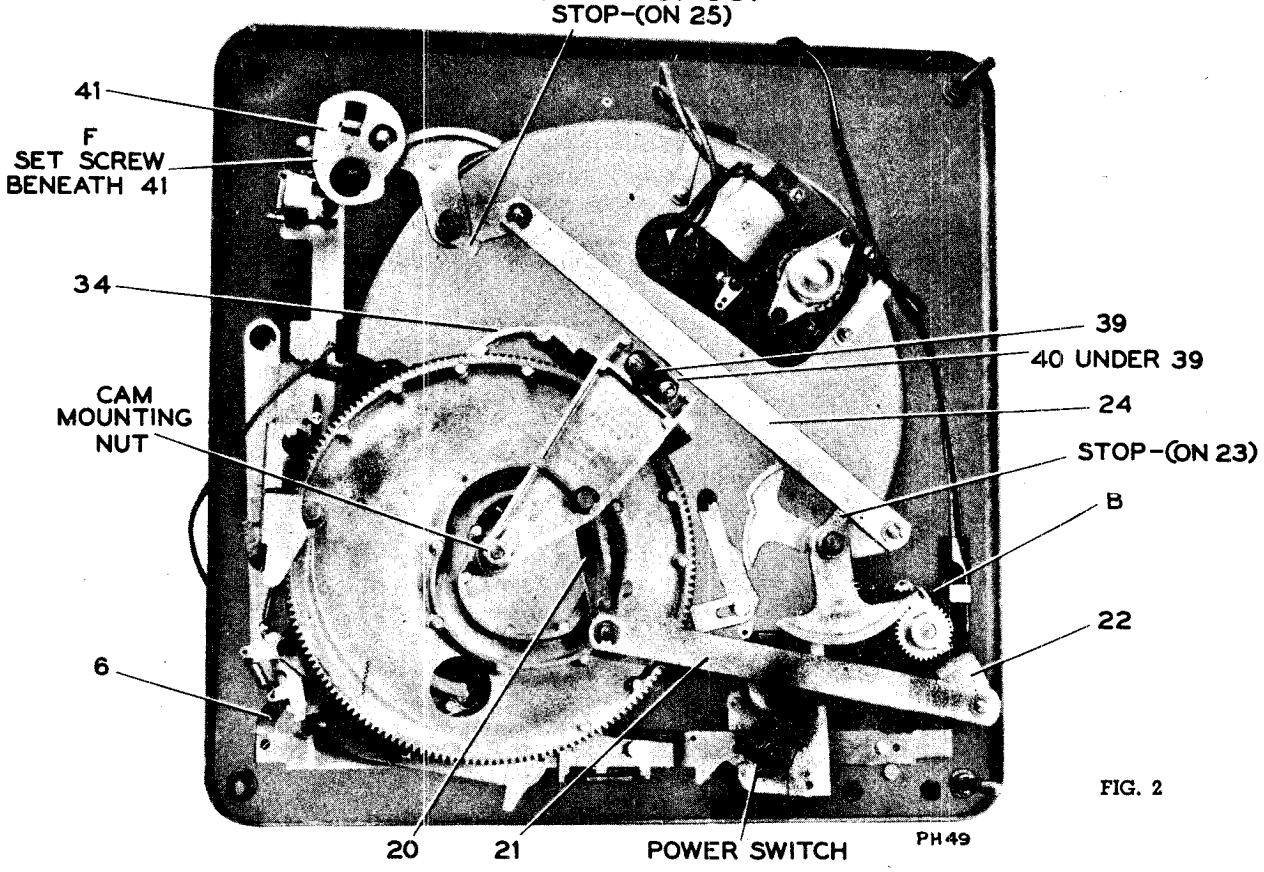

FIG. 2

3. Continuous Tripping (see sketches below)

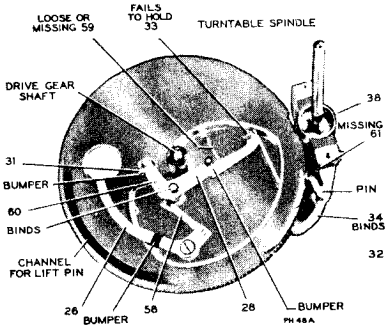
A. Trip lever (28) fails to hold clutch engagement lever (33).

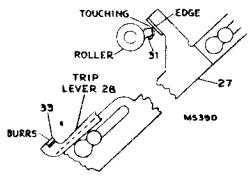
a. Loose or missing trip lever spring (59).
b. Bind in trip lever bearing.
c. Formed edge on manual reject slide (27) touching trip dog (31) (bend away).

B. Bind in stop lever (34), fig. (2).

C. Missing stop lever spring (61).

D. Control knob fails to return to automatic position due to bind in control slide, and associated parts. Missing spring (64), fig. (3).





4. Feed-back or Howl

This condition is caused by sound from the speaker getting back into the input of the amplifier.

A. Inspect motor board mounting to determine whether the clamp nuts have been loosened.

B. Make certain no portion of the mechanism is touching the cabinet. The mechanism should be free floating on mounting springs.

C. Check and replace any microphonic tube in reproducing system.

5. Failure to Trip (see sketches below)

A. Pickup jumping grooves due to improper pickup pressure, or foreign material clogging up sapphire guard.

B. Bind in trip dog (31), bearing or missing spring (60).

C. Tripping adjustments improperly set.

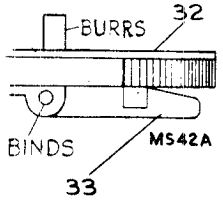
D. Trip lever spring (59) having too much tension.

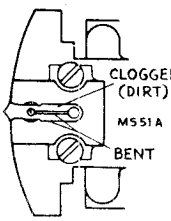
E. Burrs on trip lever (28).

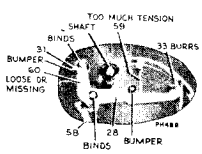
F. Bind in trip lever bearing.

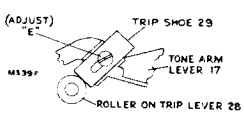
G. Bind in tone arm bearing.

H. Clutch engagement lever (33) bent or binding. (It should be free to drop under its own weight when disengaged from trip lever.)









©John F. Rider

MODELS 960001-1, 960001-2, 960001-3

RCA MFG. CO.

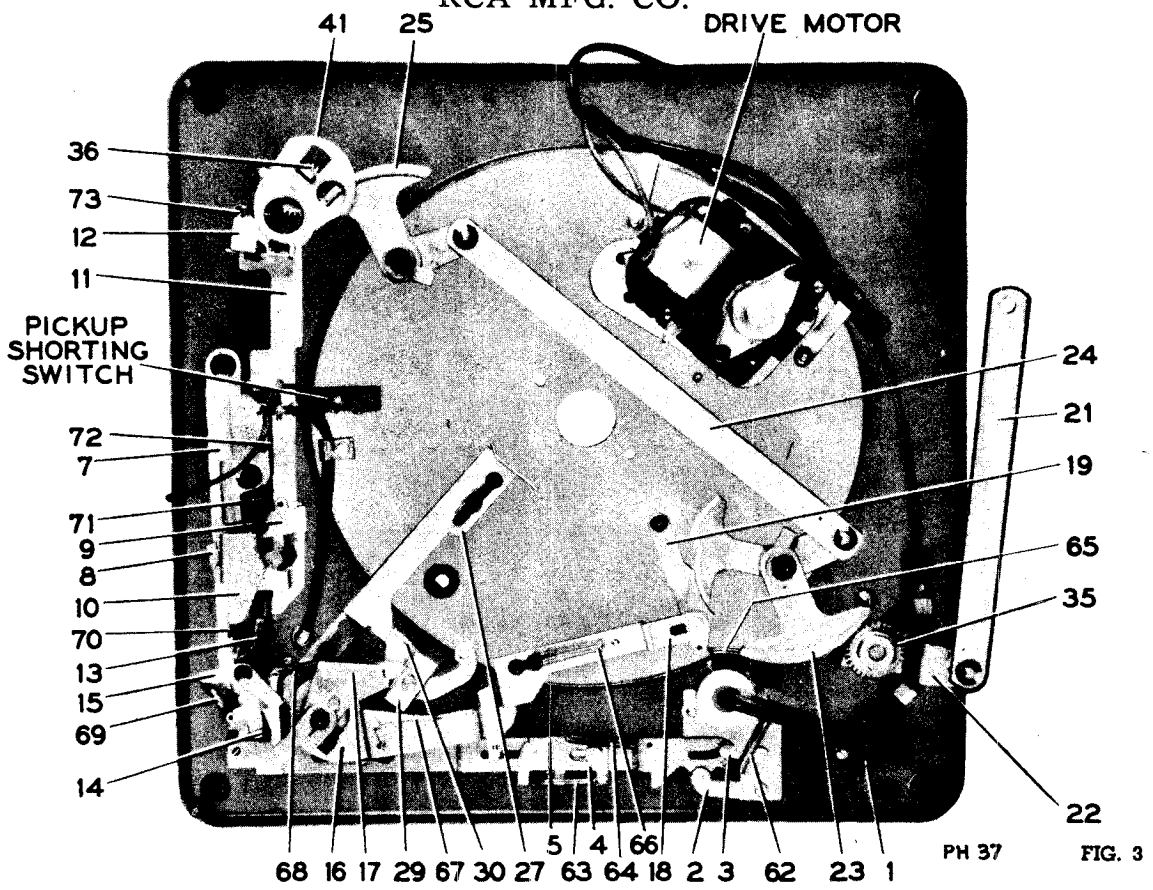


FIG. 3

6. Insufficient power to complete cycle.

A. Grease or oil on inner rim of turntable and rubber tire idler.

B. Insufficient tension of spring (57), fig. (1), on drive idler.

C. Defective drive motor.

D. Binding in series of levers, pivots, etc.

a. Drive link assembly (20), fig. (2).

b. Selector arm shaft assembly, fig. (1).

c. Drive gear (32), fig. (4), shaft.

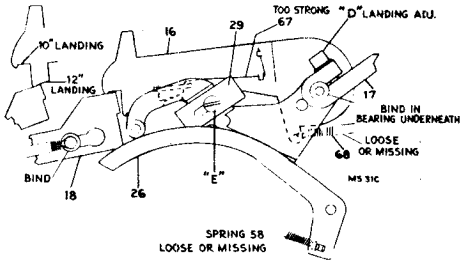
d. Poor gear mesh due to misalignment or defective teeth.

e. Bent record separator blades causing a jam, fig. (1).

G. Spring (66) having more tension than spring (65).

H. Spring (67) out of position causing false edge on lever (16).

I. Tone arm fails to move in because of bind in slide (4), or missing spring (64) keeping lever (16) latched.

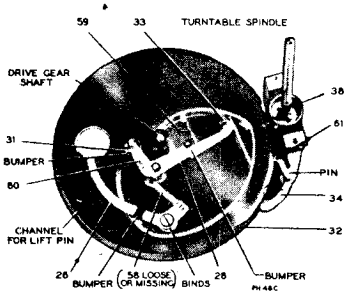


7. Records do not drop properly.

A. Separator arms improperly timed. (See timing adjustments.)

B. Bent separator blades.

C. Bent turntable spindle.



8. Improper pickup landing (adjacent sketches)

A. Landing adjustment improperly set.

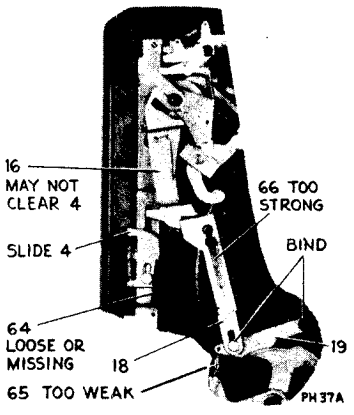
B. Bind in tone arm bearing.

C. Bind of slide (18) and lever (19) on studs.

D. Missing spring (65) or (66).

E. Bent or improperly shaped lever (16).

F. Missing or loose spring (68).



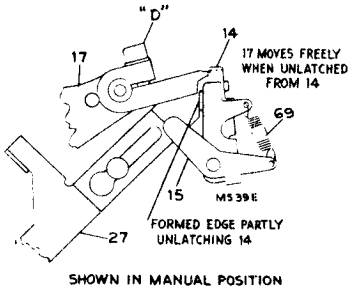
©John F. Rider

9. Repeating grooves (see sketches below)

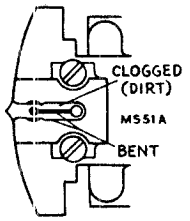
A. Insufficient pickup pressure.

B. Bind in tone arm pivot.
Place control knob in "manual" position and move tone arm in toward spindle and back. After the end of the tone arm lever (17) (functioning as a detent) leaves latch (14) the tone arm should have free and smooth action.
(If latch (14) is too positive, bend formed edge on manual reject slide (27) which contacts latch (14).)

C. Check for bind in tone arm lift pin (51).



SHOWN IN MANUAL POSITION



D. Sapphire shield filled with foreign material, preventing sapphire from setting into grooves.

E. Bent sapphire mounting thereby allowing sapphire guard to ride on record.

Tripping Adjustment

No eccentric tripping adjustment is necessary. It is automatically adjusted when landing adjustment is made.

For closed circle trip, loosen set screw "E" fig. (23), and set trip shoe (29) so as to contact roller on trip lever (28) when the sapphire is approximately 1⅝" from side of turntable spindle.

Tone Arm Height Adjustment

1. The height of the tone arm while in the rest position is that which will allow the bottom edge of the tone arm and cartridge to clear the turntable surface by 1/16".
   The height is adjusted by bending the formed edge on lower half of tone arm bracket fig. (24).
2. Tone arm height adjustment screw "A", fig. (24), should be so adjusted to allow a clearance of 1/16 inch between tone arm and record on selector arm while mechanism is in cycle.

Pickup Pressure Adjustment

By the use of a pocket postal scale hooked on the sapphire end of the tone arm, loosen set screw "G", fig. (24), and move slide until tension of spring (56) allows 1 to 1¼ oz. pickup force for model 960001-2 and 1½ to 1¾ oz. for models 960001-1 and 960001-3.

Landing Adjustment

1. With the power removed from the mechanism, place a 10-inch record on the turntable and turn the selector cam to 10-inch position.
2. Push selector knob to reject and release.
3. Push down on the small section of lever (50), fig. (20), which protrudes through selector arm #2 and rotate turntable by hand until the pickup is about to land.
4. Loosen set screw "D", fig. (25).
5. Hold tone arm lever (17) against tone arm locator (16) with just enough force so as not to have tone arm locator (16) move away from slide (18).
6. While holding the position as stated in "5," move pickup to the landing point on the record. Leave very little vertical play in tone arm bearing but just enough to have free motion of tone arm. Tighten set screw "D".
7. Apply power to mechanism and test by playing through a stack of records.

Note: Twelve-inch record landing will automatically be adjusted while adjusting 10-inch landing.

MODELS 960001-1, 960001-2, 960001-3

RCA MFG. CO.

10. Premature tripping.

A. Defective record.
B. Trip shoe (29), fig. (3), improperly set.
C. Trip lever spring (59), fig. (4), insufficient tension.
D. Bind in trip dog (31), fig. (4), pivot.

11. Noise coming from speaker during record change cycle.

Pickup shorting switch failing to short out pickup.

12. No output.

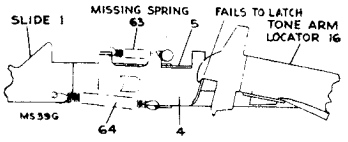
A. Defective crystal cartridge.
B. Broken or bent sapphire mounting.
C. Broken or shorted pickup cable.
D. Pickup shorting switch making contact.
E. Inoperative reproducing system.

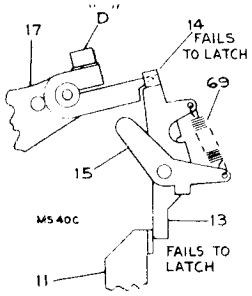
13. Distorted output.

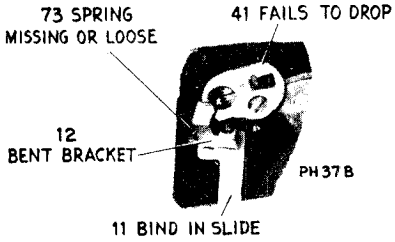
A. Defective pickup cartridge.
B. Bent or loose sapphire mounting, allowing sapphire to ride irregular in groove.
C. Sapphire guard filled with foreign material such as dust and lint which accumulates on the records while in storage.
(Remove with small brush.)

14. Tone arm fails to go to rest position at the finish of the last selection (see sketches below)

A. Control knob fails to return automatically to "off" position.
1. Cam (41) fails to drop down, thereby preventing stud on stop bracket (12) from contacting it.
2. Missing stop bracket spring (73).
3. Missing stud on bracket (12).
4. Bind in shut off dog (8), fig. (3), and trip (9).
5. Formed edge on slide (11) not locking tone arm latch (13).
6. Tone arm latch (14) bent thereby not locking tone arm and allowing it to be pushed in by lever (16).

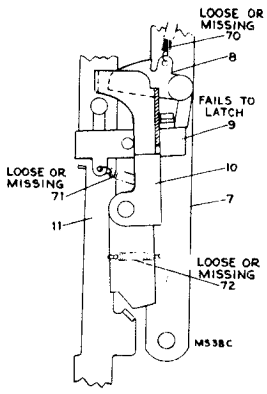


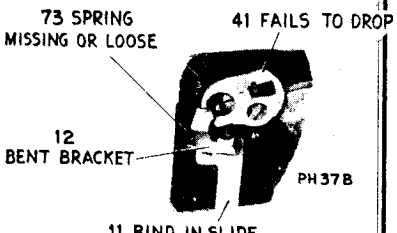


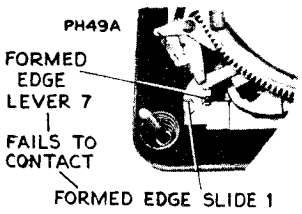


15. Turntable fails to stop at the end of the last selection (see sketches below)

A. Defective motor switch.
B. Bind in levers actuating drive motor power switch, fig. (2).
C. Control lever fails to move automatically to "off" position as described in 14A—one to five.
D. Small formed edge on lever (7) may fail to contact formed edge on slide (1) thereby not pulling slide (1) and not moving control to "off" position.

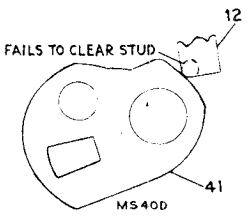


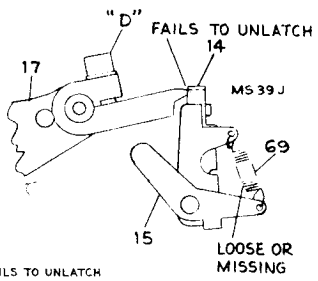


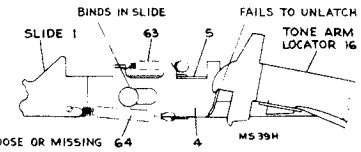


16. Pickup fails to move in for landing (see sketches below)

A. Tone arm locator (16) lever fails to unlatch from slide (4).
B. Tone arm lever (17) fails to unlatch from tone arm latch (14).
C. Missing spring (69).
D. Bent shut off slide bracket (12) which may allow cam (41) to contact at incorrect time.
E. Weak or missing spring (73), fig. (3), thus allowing slide (11) to move in and lock latch (13).







17. Power is removed from motor as pickup lands on record.

A. Shut off slide bracket (12), fig. (3), may be bent.
B. Low tension or missing spring (73), fig. (3).

Removing Main Assemblies

Removing Turntable

To remove turntable, lift straight up with a rotary motion.

Removing Separator Arms

To remove separator arm, loosen set screws and lift off.

Removing 12 in. Separator Blade

Remove Separator arm and by the use of a small screw driver remove the small screw up inside the separator sleeve (see fig. (21)). This removes the knob and 12 in. blade. The 10 in. blade is not removable.

©John F. Rider

MODELS 960001-1, 960001-2, 960001-3

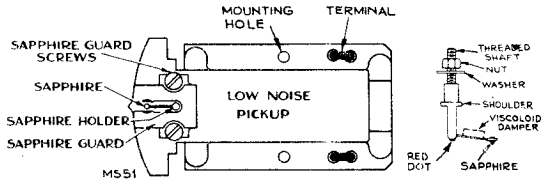
RCA MFG. CO.

Removing Sub-assembly

To remove the large gear sub-assembly, remove the turntable and remove the two small screws on either side of the turntable spindle. Also remove the large nut holding the gear shaft. The entire gear bracket, etc., can be removed easily.

Removing Tone Arm

To remove the tone arm from the mounting bracket, it is necessary to remove the two screws located under the pivot end of the tone arm. These screws are more accessible if the bracket and shaft are removed by loosening bolt "D" as indicated in fig. (16).



LOW NOISE PICKUP

Note: Stock #39851 has red dot on bottom of sapphire holder, 13.5 mil. dia. sapphire mounting wire, but no viscoloid damper. Stock #70332 has viscoloid damper on sapphire mounting wire.

Repalcement of Sapphire

Caution: Never bend the sapphire support wire.

The nut on the sapphire holder assembly is locked by a light cement (such as Glyptal). Extreme care should be used when loosening the nut so that the twisting motion does not break the crystal.

Remove the two screws holding the sapphire guard in place and remove guard. Remove the small nut and washer on the threaded shaft of the sapphire holder and push the shaft through the hole in the mounting until the sapphire holder assembly comes free.

Use of a drop or two of acetone will facilitate the removal of the nut and shaft. Do not use force as the crystal may be broken.

Insert threaded shaft of replacement sapphire holder through mounting and replace the washer and nut. Make sure that the sapphire is in the correct position. Take hold at the lower end of the shaft with a pair of pliers while tightening the nut, being very careful so as not to strip the threads or break the crystal. Replace the sapphire guard, positioning it by means of the oversize screw slots. Make certain that the sapphire and its supporting wire are centered in the guard. Tighten the guard screws. Before using, check to see that the sapphire projects far enough (approx. .020) beyond the guard so that the guard will not strike the record. If necessary, bend the guard a little. Apply a drop of light cement (such as Glyptal) to the sapphire nut holder.

RCA MFG. CO.

Automatic Cycle of Operation

Function	Explanation
Lift and turn selector arm as required for 10- or 12-inch records. Place stack of records on arms.	1. The rotation of selector arm #1 moves selector arm #2 through the mechanical linkage of gear (35), fig. (19), segment (23), tie plate (24), segment (25) and gear (36). 2. Portion of segment (23), fig. (19), sildes against set lever (19) thereby determining the point of contact of slide (18), fig. (8), with tone arm locator (16), which in turn governs the pickup landing position.
Push control lever to reject position and release.	1. Control slide (1), fig. (3), actuates manual reject slide (27) through coupling link (6), fig. (2). 2. Manual reject slide (27), fig. (3), pushes against stud above small roller on trip lever (28), fig. (4). 3. The action of trip lever (28), fig. (4), unlatches clutch engagement lever (33) allowing it to drop and engage projection on pinion gear (37), fig. (5). This engagement between lever (33) and pinion gear (37) causes the teeth of drive gear (32) to engage the teeth of pinion gear (37) starting cycle.
Drive gear (32) rotates.	1. Gear (32), fig. (6), rotates with stop lever (34), leaving notch and at the same time pickup shorting switch leaving raised portion of gear causing it to close, shorting out the pickup. 2. Roller on drive link (20), fig. (19), follows channel in drive cam. 3. Energy is transferred from drive link (20) to separator arm #1 through drive link (21), arm (22) and sleeve (47), fig. (17). 4. Separator arm #1 connected to gear (35), fig. (19), starts rotating. 5. Separator arm #2 mechanically linked through gear (35), segment (23), tie plate (24), segment (25) and gear (36) follows in rotation.
Tone arm moves out.	1. As the channel cut in rotating gear (32), fig. (9), moves, lift pin (51) raises contacting adjustment screw "A", fig. (24), on tone arm and raising tone arm. 2. Roller located on end of tone arm lever (17), fig. (8), comes in contact with portion of cam on gear (32), fig. (4), and is pushed outward and against tone arm locator lever (16), fig. (8), which is held under tension of spring (68). 3. Tone arm is locked by tone arm latch (14), fig. (12), and held from being pushed in by locator lever (16), fig. (8). 4. As drive gear continues to rotate, clutch engagement lever (33), fig. (5), is returned to normal position by sliding against edge of tone arm lever (17), fig. (8), as gear supporting it passes by.
Separator arms rotate and drop record to turntable.	1. Blades separate lower record from stack and support the stack while the record is being dropped. 2. Record drops. 3. Tone arm lever (17) is unlatched from latch (14), fig. (7), due to latch (15) making a momentary contact with raised portion of gear.
Tone arm moves in.	1. Tone arm lever (17), fig. (8), which is connected to tone arm is being moved in by locator lever (16) which is working under the tension of spring (68). During this motion tone arm lever (17) is stabilized by tone arm retard lever (26) until locator lever (16) engages slide (18) to determine 10- or 12-inch landing position. 2. Pickup is lowered to the record by lift pin (51), fig. (9), moving into channel in gear. 3. An instant before rotating gear comes to the rest position and stop lever (34), fig. (4), engages notch in gear (32), the pickup shorting switch is opened due to the blade coming in contact with raised portion of gear (32). 4. As pickup is landing and gear is returning to normal position the stud located on underside of gear (32) pushes shut-off bracket (10), fig. (13), outward. The action at this point is not transferred since shut-off dog (8), fig. (10), and shut-off trip (9) are not latched thereby allowing shut-off bracket (10) to slip by over the curved portion of the shut-off dog (8). If shut-off bracket (10) should contact straight edge of shut-off dog (8) as it does when latched to shut-off trip (9), shut-off lever (7) would pull slide (1), fig. (3), and remove power from drive motor. 5. The instant pickup lands, feed-in spring (67), fig. (8), pushes pickup into starting groove.

RCA MFG. CO.

MODELS 960001-1, 960001-2, 960001-3

Function	Explanation
Record plays.	1. Pickup moves toward center of record and into trip groove. 2. In the case of an eccentric groove the tone arm lever (17), fig. (3), moves in and the trip plate (30), fig. (4), engages trip dog (31) moving trip lever (28) and starting cycle. 3. In the case of a record with a closed circle trip the trip shoe (29), fig. (23), pushes against roller on trip lever (28), fig. (4), thus starting cycle.
Mechanism plays entire stack automatically.	Separating and dropping records, tripping, etc.
Last record has dropped and record plays.	1. Up to this time shut-off cam (41), fig. (21), located on bottom end of selector arm #2 has been held up by weight of records on selector arm applying pressure on the small raised portion of shut-off selector bracket (50), fig. (20), which is protruding through selector arm. 2. Pickup moves into trip, and drive gear (32), fig. (4), starts rotating. 3. Since cam (41), fig. (11), has dropped and is rotating with selector arm #2 its surface contacts stud on shut-off slide bracket (12). This transmits energy to shut-off slide (11), fig. (14), which permits shut-off dog (8) and shut-off trip (9) to latch. 4. Shut-off slide (11), fig. (12), locks tone arm latch (13) during the time, portion of the rotating drive gear is contacting tone arm latch (15), fig. (7), and tending to unlatch it. The tone arm remaining latched, prevents it from being pushed in by locator lever (16), fig. (8). 5. Tone arm is lowered to rest as lift pin (51), fig. (9), goes into channel in gear (32). 6. As gear (32) comes to rest stud, fig. (13), located on underside of gear (32) contacts and pushes shut-off bracket (10) outward. Since shut-off dog (8), fig. (14), and shut-off trip (9) are latched, shut-off bracket (10) contacts flat surface of shut-off dog (8) pushing shut-off lever (7) outward. 7. Shut-off lever (7) in its outward movement contacts lip on slide (1), fig. (3), pulling control knob to "off" position, cutting off the power to the drive motor. During this action, shut-off dog (8), fig. (14), and shut-off trip (9) are unlatched.

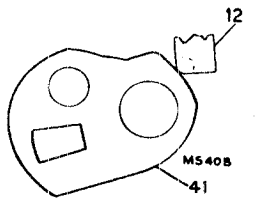

FIG. 11

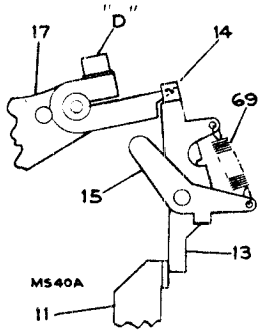

FIG. 12

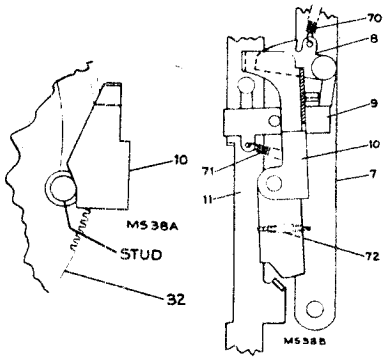

FIG. 13 FIG. 14

Manual Cycle

Function	Explanation
Push control knob to manual.	1. Slide (1), fig. (3), supporting control knob moves and positions "manual" lock-out slides (4) and (5), fig. 15), so as to have slide (4) engage and hold tone arm locator (16) and prevent it from pushing tone arm lever (17), fig. (8), in for pickup landing. 2. Slide (1), fig. (3), also energizing manual reject slide (27), fig. (16), so as to have the lip on slide (27) push against tone arm latch (14), moving the point of contact on tone arm lever (17) to the very edge. This permits tone arm lever (17) to slip by when tone arm is moved manually. 3. The movement of manual reject slide (27) has so positioned the slide so as to lock the clutch engagement lever (33) and prevent it from engaging offset in pinion gear (37), fig. (5), when trip lever (28), fig. (16), is moved. 4. All portions of the cycling mechanism are locked during manual operation and remain stationary with the pickup shorting switch in the off position at all times, excepting Models –2 and –3 which have an additional switch, shorting out pickup when tone arm is in the rest position. Note: When operating manually the tone arm should always be returned to rest position before moving control knob to the off position. If this procedure is not followed the trip lever (28) may not hold the clutch engagement lever (33) allowing it to drop and start cycle.
Allen wrenches required for adjustments.	3/32 in. between flats, for Allen wrenches required for adjustments on set screws #10 and 12, stock #22111. 5/32 in. between flats, for 5/16 in. set screws, stock #22113. 3/16 in. between flats, for ⅜ in. set screws, stock #26581.

Check on Timing Adjustments

A quick check for correct timing of mechanism can be made by:

1. Have mechanism out of cycle.
2. Lift and turn separator arm #1 to 10 in. position and place a 10 in. record on arms.
3. The 10 in. separator blade should have a definite relation to record as illustrated in fig. (18) when segment (23) is against tie plate (24) as illustrated in fig. (19). If so, selector arm #1 is correctly timed.
4. If the 10 in. blades of both arms have the same distance from the record, remove record and lift and turn selector arm #1 counterclockwise as far as it will go (viewed from top).
5. Segment (25) should be against tie plate (24) when the teeth of segment (25) and gear (36) are meshed as shown in fig. (22). If this exists, timing of selector arm #2 is correct.

Timing Adjustments for Record Separators

1. Make certain mechanism is out of cycle and all parts in their proper place by comparing the mechanism with sketches and photographs.
2. Remove "C" washer on bearing of segment (23), fig. (19), and disengage the teeth of segment (23) and selector arm gear (35).
3. Selector arm #1, fig. (17), should be in place with the pin of selector shaft engaged in the large slot of selector arm and the small projection of selector arm sleeve (47) engaged in the small slot of the selector arm. Arm (22), fig. (19), should also be in place and connected to the drive link (20) and drive link connecting rod (21).
4. Loosen set screw "B", fig. (17), and wedge some object such as a screw driver in the clamp of arm (22) so as to allow free movement of selector arm sleeve (47).
5. Place 10-inch record on selector arms and turn selector arm #1, fig. (18), until the 10-inch blade is approximately ¼ inch from the edge of the record.
6. Tighten set screw "B", fig. (17).
7. Rotate the disengaged segment (23), fig. (19), clockwise until tie plate (24) comes against stop on segment (23). Hold in this position while engaging teeth of segment (23) and teeth of gear (35).
8. Replace "C" washer on segment (23).
9. Remove "C" washer on rod (41), fig. (21) (under selector arm #2) and remove cam and rod (41).
10. Remove "C" washer on bearing of segment (25), fig. (22), and disengage teeth of segment (25) and gear (36).
11. Lift and rotate selector arm #1, fig. (22), counter-clockwise until stop on segment (25) is against tie plate (24).
12. Engage teeth of segment (25) and gear (36) so as to have the first tooth of segment gear (25) engage the gear (36) between the first and second tooth next to slot as shown in sketch, fig. (22). Replace "C" washer or bearing of segment (25).
13. Loosen set screw "F" and rotate selector arm #2 until ten-inch separator blade is the same distance from the edge of the record as selector arm #1, fig. (18).
14. Tighten set screw "F", fig. (22).

    Note: Do not try to position separator arm #2 by loosening small set screws on arm proper. The factory has countersunk the shaft, seating the set screws.

15. Replace cam (41), fig. (21), with the end going up through hole in plate (50), fig. (20). Insert "C" washer, fig. (21), to hold in place.

Model No. 960015

Automatic Record Changer

SERVICE DATA

— 1945 No. 11 —

RADIO CORPORATION OF AMERICA
RCA VICTOR DIVISION
CAMDEN, N. J., U. S. A.

Alternate tone arm provided with a long life semi-permanent needle

Features

1. This mechanism is designed to play automatically a series of twelve 10-inch or ten 12-inch standard records of the 78 r.p.m. type.
2. It will play manually records up to 12 inches in diameter.
3. Tripping system is of "constant diameter" type, insuring reliable automatic operation on all records made to RMA proposed standards.
4. It is a simple operation of turning one record support to change from 10 to 12-inch records or vice versa.
5. Cycling mechanism is disconnected completely while records are being played. This reduces the load on the drive motor, thereby reducing the tendency for "wow" or rumble.
6. Mechanism can be adapted for 50 cycle operation by interchanging the spring sleeve slipped over the shaft of the drive motor.
   On motors provided with a solid sleeve on drive shaft, slip the correct conversion spring sleeve over solid sleeve.

Automatic Operation

1. With the power switch in the off position rotate the record support shelf as required for 10 or 12-inch records until the record size indicated on the support cover is pointing toward the center post.
2. Place the records to be played in a stack with desired selections upward and in proper sequence with the last record on top. Load them on the changer by placing them over the center post and resting on the record support shelf. Place record stabilizing clip on top of the record stack.
3. Turn power switch on and press down firmly but momentarily on the end of the tone arm and let go. The changer will continue to play the entire stack automatically.
   The tone arm can be moved to the rest position any time the mechanism is not in cycle.
4. Turn the power switch off and remove the stack from the turntable by placing fingers of both hands directly opposite and under the stack. Then lift straight up—"don't tilt" or squeeze stack. Turning the support shelf one-fourth turn facilitates removal of records.

   NOTE: DO NOT OPERATE MECHANISM WITH THE RECORD SEPARATOR SHELF TURNED TO ANY POSITION OTHER THAN THE NORMAL 10-INCH OR 12-INCH OPERATING POSITION.

   When the mechanism is not in use, it should be out of cycle and the tone arm on the rest.

   No attempt should be made to turn record separator shelf while mechanism is in cycle.

Manual Operation

1. Rotate the record separator shelf to 10 or 12-inch position (numerals 10 or 12 pointing towards center post).
2. Place the record to be played on the turntable and turn the power switch on.
3. Place the pickup on the start of the record.
   Note: The mechanism should be allowed to complete cycle before attempting to move tone arm to the rest position.
4. Turn power switch off manually.
5. Remove the record by raising straight up without tilting.

Cautions

1. Do not attempt to handle tone arm while mechanism is in cycle.
2. Never turn the power switch off, leaving the mechanism in cycle for an extended period of time.
3. Do not allow the records to remain on supports when not in use.
4. Do not allow oil or grease to come in contact with any rubber parts.
5. Do not install instrument near source of heat. Excessive heat may damage the pickup cartridge.
6. Do not pack and ship changer without first pushing down on reject button to release catch.
7. When replacing the needle do not tighten set screw excessively as the twisting may crack the crystal.

Functions of Principal Levers

Trip Lever (fig. 4)
When the pickup has moved beyond the end of the recorded section of the record, the trip lever pulls stud (15) past trip catch to start automatic cycle.
Cycling Drive Cam (fig. 5)
Transfers motion from turntable for cycling action.
Cycling Slide (fig. 5)
Provides mounting for cycling cam bearing and transfers energy to tone arm elevating rod and separator slide.
Tone Arm Lever (fig. 6)
Directs the horizontal movement of tone arm.
Tone Arm Locking Cam (fig. 3)
Locks tone arm to record slide actuating lever to provide landing movement.
Tone Arm Elevating Rod (fig. 1)
Transfers motion from cycling slide to elevate tone arm while cycling.
Actuating Lever Shaft (fig. 1)
Transfers motion to and from separator slide.
Record Separator Slide (fig. 2)
Pushes records off support notch on center post.
Center Post (fig. 7)
Main record support incorporating the separator latch.
Separator Latch (fig. 7)
Small slide set in a vertical keyway in the top end of the center post, provides means for separating the records.
Lubrication
Under normal operating conditions the motor should never require oiling.
On points of contact on slides and levers and on all bearing surfaces except the motor bearing use a light application of Lubriplate No. 107.

©John F. Rider

MODEL 960015

RCA MFG. CO.

Preliminary Adjustments in Assembling Mechanism

1. Make certain the mechanism is out of cycle and all the levers, cams, springs, etc., on the underside of the mechanism are in place by comparing it with sketches and photographs.
2. Latch the reject actuating slide by pulling slide in guide until it engages the reject latch (fig. 4).
3. With the tone arm and record separator shelf removed, assemble the parts shown in fig. 3.
4. Rotate tone arm mounting bracket assembly counterclockwise against stop stud (16), (fig. 3).
5. Studs 17 should be in the position indicated in fig. 3, when the trip stud (15) (fig. 4) is pulled toward the record center post as far as it will go.
6. Tighten set screws "E" (fig. 3), allowing very little vertical play in tone arm pivot (but not binding).
7. Place record separator shelf in position, with the tone arm locking cam in the position indicated in fig. 3.
8. Mount separator shelf with mounting screws "i" (fig. 1).
9. Adjust record slide actuating lever to a position approximately 3/8 inch from bracket as indicated in sketch (fig 2). Tighten set screws "G." Slide actuating lever should be under adjustment studs (A or B) and have enough clearance to prevent touching.
10. When the foregoing adjustments have been made, remove record slide assembly by removing screws "i" and assemble tone arm by snapping mounting hinge over bearing studs.
11. Replace slide assembly by feeding tone arm locking cam, down through the hole in tone arm and engaging studs (17). Make certain all levers remain in correct position while engaging cams and studs (17) and replacing mounting screws "i."
12. Mechanism can now be turned by hand to check its action. It should require only minor adjustments for tone arm height, landing and tripping. A description of these adjustments may be found under their respective heading.

Adjustments

A—12" landing.
B—10" landing.
D—Tone arm height adjustment screw.
E—Locking (set screw) for positioning elevating rod in relation to tone arm.
F—Tripping adjustment.
G—Locking (set screw) for positioning record slide separator actuating lever and landing positioning lever.

Landing Adjustment

1. It is necessary to remove record support cover by prying out the four round clips at the lower edge of the cover.
2. Turn the record support to 10 or 12-inch position and place record on turntable.
3. With power removed from mechanism, push down on reject button and allow to cycle while rotating it by hand. Note where the needle lands.
4. Loosen lock nuts and adjust (B) for 10-inch landing and (A) for 12-inch landing. Turning studs counterclockwise moves the landing in, and turning clockwise moves the landing to the outer edge.
5. Turn power on and allow mechanism to cycle by pressing down on reject button. This should be repeated several times and adjusted until the pickup lands consistently at the beginning of the record.
6. Hold adjustment bolts with wrench and tighten lock nut. Test by playing through a stack of records.

Tripping Adjustment

Tripping should occur when the needle is approximately 1⅝ inches from the side of center post. If the mechanism fails to trip at the proper point, turn adjustment screw (F) clockwise to delay, and turn counterclockwise to advance the tripping point. Try a few standard records to determine whether tripping is properly adjusted.

Tone Arm Height Adjustment

1. Remove the power from the mechanism.
2. Place a stack of ten 12-inch or twelve 10-inch records on the turntable. With the mechanism in cycle, rotate the turntable by hand. The tone arm should clear the top record without touching the record on support post above.
3. Adjust screw (D) for this condition.

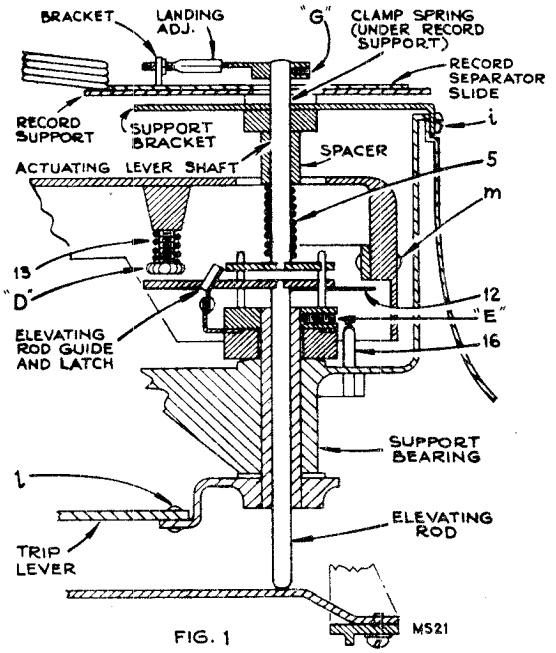

FIG. 1

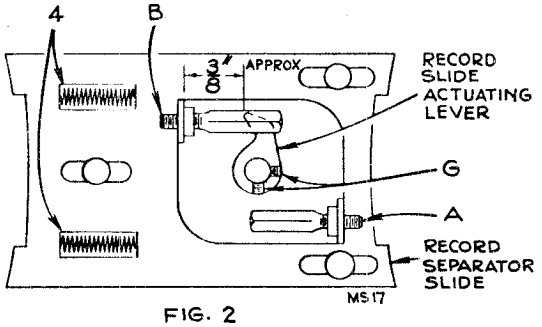

FIG. 2

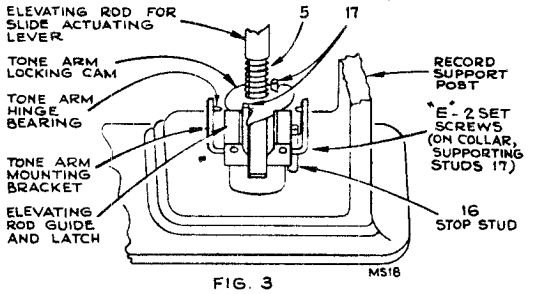

FIG. 3

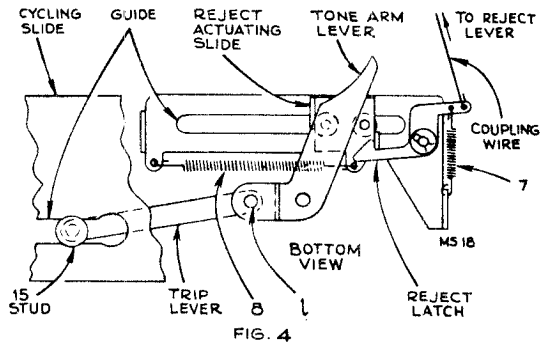

FIG. 4

RCA MFG. CO.

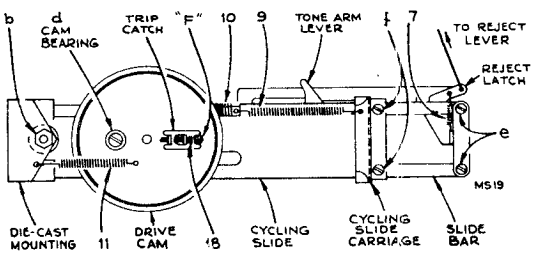

FIG-5

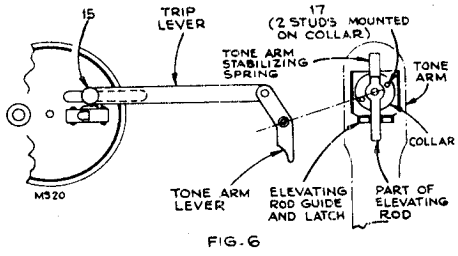

FIG-6

Cycle of Operation

FUNCTION	EXPLANATION
Power Switch.	1. Energizes drive motor, causing turntable to rotate.
Reject Button.	1. Tone arm is resting on reject button, therefore pushing down on arm actuates reject button. 2. Reject button pushes down on reject lever. 3. Reject lever transfers action to reject latch lever through coupling wire. 4. Reject actuating slide being unlatched, is pulled against tone arm lever by spring (8).
Trip lever moves away from center post.	1. Energy is transferred from tone arm lever to trip lever through hinge bearing (l). 2. Stud (15) slides in guide cut in cycling slide. 3. Stud (15) slides past trip catch.
Cycling cam rotates.	1. Trip catch being free, spring (11) pulls the eccentric drive cam around causing the rubber tire rim to contact the knurled drive roller. 2. The bearing of cycling cam is mounted on cycling slide, therefore rotation of the eccentric cam causes the slide to move on the slide bars, against the tension of spring (10) and away from center post.
Cycling Slide moves away from Conter Post. Tone arm raises.	1. Cycling slide being curved at the tone arm bearing end, it starts to push up on tone arm elevating rod. 2. Elevating rod in raising, pushes against adjustment screw (D) causing the tone arm to raise on hinge bearing. 3. Tone arm elevating rod in raising, pushes against record slide actuating lever rod, thus raising the record slide actuating lever. 4. Slide moving further, causes takeup safety slide to push against tone arm lever, thereby moving tone arm out and transferring energy through record slide actuating lever shaft to slide actuating lever. 5. Tone arm locking cam, latches on inner edge of tone arm elevating rod guide. This couples the tone arm to record slide actuating lever through record slide actuating lever shaft. 6. Record slide actuating lever pushes against stud (A or B) causing record slide to push record forward off the center post rest. 7. Record drops and springs (4) cause slide to return to normal position. 8. Stud (A or B) on record slide returning, pushes against slide actuating lever, transferring the motion to tone arm which moves the tone arm in for landing. 9. When cycling slide is moving away from center post towards its limits, slide takeup lever resets the reject actuating slide.
Slide returns and pickup lands.	1. Tension of spring (10) keeps cam in contact with rotating knurled roller, thereby causing cycling slide to return towards its normal position. 2. Cycling cam moving towards minimum diameter is pulled off center and away from knurled roller by spring (11). Stud (15) engages trip catch and holds cam from engaging knurled roller. 3. During operation (2) above, the tone arm elevating rod lowers, unlatching tone arm locking cam and allowing the pickup to land on the record.
Playing cycle.	1. Trip catch is held against stud (15), until pickup moves in close enough to center post for stud (15) to clear the trip catch, thereby starting a new cycle.

Record Separation
It is necessary that some provision be made to prevent the record adjacent to the record being released from dropping at the same time. This is accomplished by the separator latch located at the end of the center post. It may be found necessary to bend the center post if the records do not separate properly. There should be 1/32 to 1/16 inch clearance between the edge of the lower record and the end of the slide.

Removing Tone Arm
First it is necessary to remove the record support shelf by removing the two mounting screws (i). Then tilt and raise slowly.
The entire record slide actuating lever, bearing rod, and spring will come off with the record support assembly. The tone arm may then be removed by disengaging the hinge bearing. This may be done by prying with a screw driver through the opening in the top of the arm.

Removing Turntable
Remove the center post by removing nut (b) (fig. 7) and tapping end of center post. The turntable can then be removed by loosening set screw (c) on knurled roller and pulling upward with a rotary motion.

Removing Pickup Cartridge
Remove the two screws holding the cartridge and unsolder shielded leads.

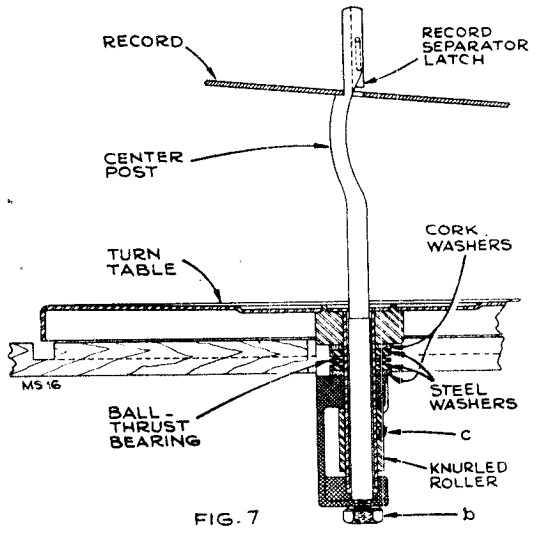

FIG. 7

©John F. Rider

RCA MFG. CO.

Miscellaneous Service Hints

(1) **Rumble**

(A) Remove motor assembly (mounting bolts "K," fig. 9) and inspect rubber tire idler for rough spots.

(B) Make certain rubber shock supports (a) on drive motor and mechanism are not drawn up too tight.

(C) Make certain cork washers are in place on turntable bearing (fig. 7).

(D) Check for microphonic tube in amplifier.

(2) **"Wow" or Speed Variation**

(A) With mechanism out of cycle remove motor assembly (bolts "K," fig. 9) and examine rubber drive idler and rim of turntable for grease or oil. (Oil or grease can be removed with carbontetrachloride or naphtha.)

(B) Check for bent motor shaft.

(C) Check for bent motor mounting plate.

(D) Check for irregularity in rubber tire idler.

(E) With the drive motor removed, the turntable should rotate freely when turned by hand. Bind in turntable may be caused by:

1. Burrs in bearing support casting.
2. Bent center post.
3. Improperly seated center post.
4. Gummed grease in thrust bearing.
5. Under side of turntable rubbing due to insufficient clearance. (It may be necessary to add an additional washer on turntable bearing to elevate it sufficiently to clear mounting bracket, etc.)
6. Cycling knurled drive roller set too low on turntable shaft thereby acting as a thrust bearing and making the ball thrust bearing ineffective. Loosen adjustment screw "C" and allow turntable to seat on thrust bearing making certain steel and cork washers aren't missing. In positioning the knurled roller about 1/32 inch vertical play should be allowed.
7. Friction between a stack of records and center post may cause squeaking. It may also place an additional load on drive motor, causing "wow." An application of wax on the center post should remedy this condition.

(3) **Continuous Tripping** may be caused by:

(A) Trip stud "15" not engaging trip catch.

(B) Reject button sticking.

(C) Reject latch lever spring (7) being loose or missing.

(D) Worn reject latch lever.

(E) Bent reject actuating lever at point of contact to latch. (Will not remain latched.)

(F) Missing or broken safey spring (9).

Special Tools Required for Servicing Mechanism

1. 5/16 Bristo set screw wrench.
2. 3/8 Bristo set screw wrench.
3. 5/16 inch open end wrench. } Two separate wrenches re-
4. 1/4 inch open end wrench. } quired.

(4) **"Feedback or Howl"**

This trouble is caused by energy from the speaker getting back into the input of the amplifier.
Check for:

(A) Microphonic tube.

(B) Gain control advanced too far.

(C) Mounting rubber "shocks" bolted down too tight.

(5) **Failure to Trip** may be caused by:

(A) Pickup not following grooves due to:

1. Bind in tone arm bearing. (Will also cause erratic landing.)
2. Improper adjustment of trip catch (F).
3. Binding in hinge bearing. (May also cause repeating of grooves.)
4. Bind in trip stud guide. (May also cause repeating of grooves.)
5. Tone arm height adjustment (D) set too high. (May cause tone arm to hit the records on support post.)

(6) **Improper Landing of Pickup**

(A) Landing adjustments (A or B) improperly set. (See landing adjustments.)

(B) Spring (9) loose or missing.

(C) Springs (4) out of position. (Separator slide will also fail to return.)

(D) Loose adjustment bolts (E or G). (Records will also fail to drop.)

(E) Broken or bent elevating rod guide. (Tone arm locking cam (fig. 3) should remain locked to elevating rod guide until the very instant before pickup lands.)

(F) Bind in tone arm support bearing.

(G) Tone arm locking cam may not engage catch.

(H) Tone arm locking cam may not disengage catch. (Bend elevating rod guide.)

(G) Tone arm mounting rivets loose.

(7) **Repeating Grooves on Record**

(A) Height adjustment (D) set too high.

(B) Bind in tone arm support bearing.

(C) Bind of trip stud (15) in guide.

(D) Bind in tone arm hinge bearing (1) (fig. 4).

(8) **Premature Tripping**

(A) Adjustment (F) improperly set. (See trip adjustment.)

(B) Loose trip stud (15).

(9) **Changer will not complete cycle**

(A) Worn rubber tire on drive cam.

(B) Loose cycling knurled drive gear or roller.

(C) Defective drive motor.

(D) Bent or improperly assembled parts.

(10) **Changer starts cycling when support post is rotated for size. May be caused by:**

Slide actuating lever contacting landing adjustment bolts. (Bend landing adjustment bolt bracket to allow clearance for lever when not in cycle.)

Functional Parts

(See illustrations for identification)

Drive wheel tension spring (1).
Record stabilizing clip spring (2).
Clamp spring to hold record separator support bracket to record separator (3).
Record separator slide return spring (4).
Lowering spring for record slide actuating lever (5).
Reject lever return spring (6).
Reject latch spring (7).
Reject actuating slide spring (8).
Cycling slide take-up safety spring (9).
Slide return spring (10).
Drive cam actuating spring (11).
Tone arm stabilizing spring (12).
Elevating adjustment screw locking spring (13).
Snap fasteners on support shelf cover (14).
Trip stud (15).
Tone arm stop stud (16).
Tone arm and slide actuating lever connecting studs (17).
Tripping adj. bolt, lock spring (18).

Small letter Part Designation:

a—Rubber shock mounts.
b—Center post mounting nut.
c—Knurled drive roller mounting screw.
d—Cycling drive gear mounting screw.
e—Slide rod mounting screws.
f—Cycling slide carriage mounting screws.
g—Reject lever mounting screws.
h—Reject button mounting nut.
i—Record support post mounting screws.
j—Pickup mounting screws.
k—Mounting bolts on motor.
l—Trip lever hinge bearing.
m—Tone arm mounting rivets.
n—Main assembly mounting bolts.

Names of Levers and Parts

Cycling slide carriage.
Cycling slide carriage stop sleeve.
Cycling slide bars.
Cycling drive cam bearing.
Cycling drive cam.

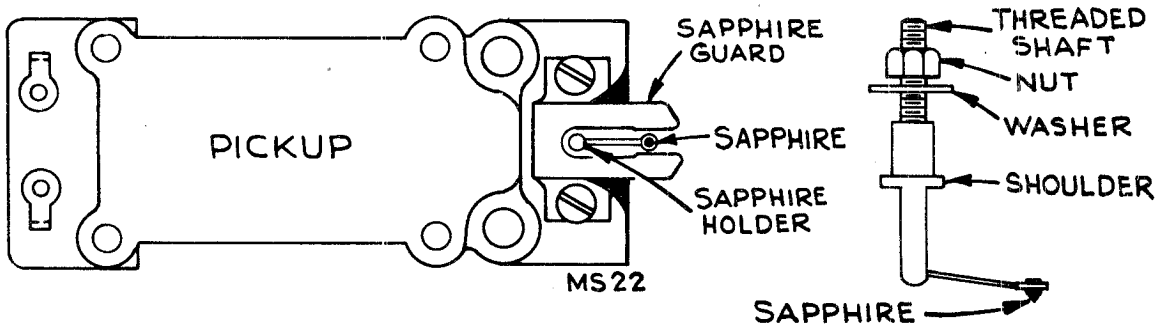
Tone arm locking cam.
Actuating lever shaft.

Replacing Sapphire in Pickup



Replacement of Sapphire

Caution: Never bend the sapphire support wire.

The nut on the sapphire holder assembly is locked by a light cement (such as Glyptal). Extreme care should be used when loosening the nut so that the twisting motion does not break the crystal.

Remove the two screws holding the sapphire guard in place and remove guard. Remove the small nut and washer on the threaded shaft of the sapphire holder and push the shaft through the hole in the viscoloid until the sapphire holder assembly comes free.

Use of a drop or two of acetone will facilitate the removal of the nut and shaft. Do not use force as the crystal may be broken.

Insert threaded shaft of replacement sapphire holder through viscoloid and replace the washer and nut. Make sure that the sapphire is in the correct position. Take hold at the lower end of the shaft with a pair of pliers while tightening the nut, being very careful so as not to strip the threads or break the crystal. Replace the sapphire guard, positioning it by means of the oversize screw slots. Make certain that the sapphire and its supporting wire are centered in the guard. Tighten the guard screws. Before using, check to see that the sapphire projects far enough (approx. .020) beyond the guard so that the guard will not strike the record. If necessary, bend the guard a little. Apply a drop of light cement (such as Glyptal) to the sapphire nut holder.

MODEL 960015

RCA MFG. CO.

Replacement Parts

STOCK No.	DESCRIPTION
	PICKUP AND ARM ASSEMBLIES
71172	Arm—Tone arm complete less crystal, shielded lead, height adjusting screw and spring
71169	Clamp—Spring clamp to hold pickup leads in arm
71173	Crystal—Pickup crystal cartridge
71170	Screw—Height adjusting screw (D) (fig. 1)
71174	Screw—Needle screw
71171	Spring—Lock spring for height adjusting screw (13) (fig. 1)
71283	Arm—Tone arm complete less crystal, shield lead, height adjusting screw and spring (used with crystal cartridge 70338 only)
70338	Crystal—Pickup crystal cartridge (permanent sapphire type used in arm 71283 only)
	MOTOR ASSEMBLIES Stamped 407B1
71177	Pin—Cotter pin (hairpin spring) for drive idler wheel for motor stamped 407B1
71178	Shim—Drive idler wheel thrust shim for motor stamped 407B1
71176	Spring—Drive idler wheel tension spring for motor stamped 407B1 (1)
71175	Wheel—Drive idler wheel for motor stamped 407B1
	MOTOR ASSEMBLIES Stamped 407B2
71181	Pin—Cotter pin (hairpin spring) for drive idler wheel for motor stamped 407B2
71182	Shim—Drive idler wheel thrust shim for motor stamped 407B2
71180	Spring—Drive idler wheel tension spring for motor stamped 407B2
71179	Wheel—Drive idler wheel for motor stamped 407B2
	MOTOR ASSEMBLIES Stamped 407B3
71186	Bushing—Motor shaft drive pulley for motor stamped 407B3
71183	Motor—Motor complete 117 volts 60 cycle
71226	Pin—Cotter pin (hairpin spring) for drive idler wheel for motor 407B3
71187	Shim—Drive idler wheel thrust shim for motor 407B3
71185	Spring—Drive idler wheel tension spring for motor stamped 407B3 (25 turns—1½" long x 5/32" O. D.)
71184	Wheel—Drive idler wheel for motor stamped 407B3
	MOTORBOARD ASSEMBLIES
71233	Bar—Record stablizing clip support bar
71203	Base—Operating mechanism mounting base and support bearing (fig. 1)
71238	Bearing—Turntable thrust bearing (fig. 7)
71210	Bracket—Record separator support bracket (fig. 1)
71218	Bracket—Tone arm mounting bracket (fig. 3)
71230	Button—Reject button and tone arm rest (fig. 8)
71240	Cable—Shielded output cable complete with plug
71194	Cam—Main cam complete (fig. 5)
71213	Cam—Tone arm locking cam (fig. 3)
71206	Carriage—Cycling slide carriage (fig. 5)
71195	Catch—Trip catch mounted on main cam (fig. 5)
71211	Clamp—Clamp spring to hold record separator support bracket to record separator (3) (fig. 1)
71219	Collar—Collar support for guide studs (17) (fig. 1)
14086	Cord—Power cord
71231	Cover—Shelf cover and record stablizing clip
71234	Fastener—Push fastener for record holder cover (4 req'd)
71245	Grommet—Rubber grommet to mount changer (4 rec'd)
71244	Grommet—Rubber grommet to mount motor (3 req'd)
71222	Latch—Reject latch (fig. 4)
71214	Lever—Record slide actuating lever—pushes adjusting screws mounted on record separator to drop records (fig. 2)
71227	Lever—Reject lever (fig. 9)
71229	Link—Reject lever (wire) link (fig. 4)
71202	Link—Trip link and tone arm lever assembly (fig. 4)
71236	Nut—Centre post locknut (b) (fig. 7)
71226	Pin—Cotter pin to mount reject latch (fig. 4)
31048	Plug—Plug for output cable
71235	Post—Centre post (fig. 7)
71189	Rail—Guide rail (cycling slide bar) (2 req'd) (fig. 5)
71217	Rod—Tone arm elevating rod
71199	Roller—Main cam drive roller (knurled) (fig. 7)
71201	Screw—No. 6-32 x 3/16" bristo head screw for mounting guide pin and collar assembly (2 req'd) or mounting the separator adjusting screws actuating rotor (2 req'd) G
71192	Screw—No. 6-32 x ½" fillister head screw to mount guide rails (4 req'd)
71200	Screw—No. 8-32 x ⅛" bristo head set screw for main cam drive roller (C)
71197	Screw—Adjusting screw—mounted on main cam—No. 6-32 x ⅛" round head machine screw (F)
71212	Screw—Adjusting screw and locknuts for tone arm landing (2 req'd) (A, B)
71208	Separator—Record separator (fig. 2)
71207	Slide—Cycling slide (fig. 5)
71220	Slide—Reject actuating slide and bracket—less reject latch and spring (fig. 4)
71216	Spacer—Lowering spring spacer (fig. 1)
71224	Spacer—Reject latch mounting spacer
71205	Spring—Drive cam actuating spring (11) (55 turns—1½" long x 7/32" O. D.)
71191	Spring—Guide rail recoil spring (10) (23 turns—4½" long x 13/32" I. D.)
71215	Spring—Lowering spring for record slide actuating lever (5) (10 turns—11/16" long x ¼" O. D.)
71209	Spring—Record separator return spring (2 req'd) (4) (10 turns—¾" long x .244" O. D.)
71232	Spring—Record stabilizing clip tension spring (2) (10 turns—½" long x 3/16" O. D.)
71223	Spring—Reject latch spring (7) (20 turns—11/16" long x ⅛" O. D.)
71228	Spring—Reject lever spring (25 turns—⅞" long x 5/32" O. D.)
71204	Spring—Safety spring (9) (30 turns—1 7/32" long x 7/32" I. D.)
71221	Spring—Spring for reject slide and bracket (8) (31 turns—⅝" long x 3/16" O. D.)
71140	Spring—Spring to convert motor stamped "407B1" from 60 to 50 cycle operation
71141	Spring—Spring to convert motors stamped "407B2" from 60 to 50 cycle operation
71142	Spring—Spring to convert motors stamped "407B3" from 60 to 50 cycle operation
71196	Spring—Tripping adjustment bolt lock spring mounted on main cam (18) (7 turns—23/32" long x .203" O. D.)
71190	Stop—Stop sleeve for guide rail (fig. 9)
71188	Support—Turntable mounting support and guide rails support (fig. 7)
71193	Support—Main cam support (fig. 9)
71198	Tire—Main cam rubber tire
71237	Turntable—Finished turntable plate
71225	Washer—Reject latch spring washer
71239	Washer—Cork washers (1 set) for turntable (fig. 7)

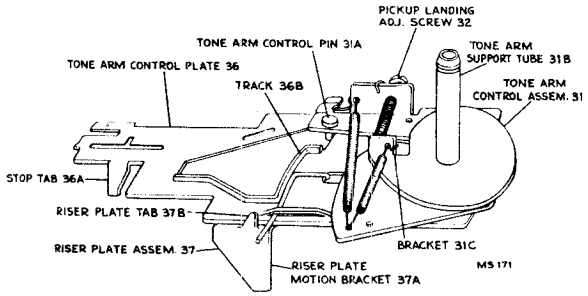

FIG. 2

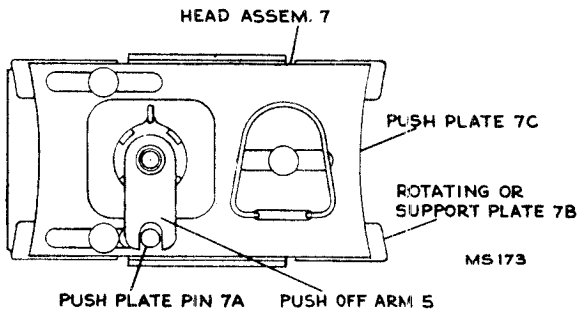

FIG. 4

FUNCTIONS OF PRINCIPAL PARTS

Head Assembly—7, 7A, 7B, 7C

Supports outer edge of record stack and pushes the record off notch in center post and allows it to drop to the turntable while the mechanism is going through cycle.

Center Post—27, 27A

Supports the entire stack of records, and together with the offset notch and latch in the center post, provides a means for separating records.

Tone Arm Lift Assembly—19

Couples tone arm to riser plate 37 through arm lift shaft 42A, thereby transferring the action for the vertical motion of the tone arm during change cycle.

Arm Control Assembly—31, 31A, 31B, 31C

Provides a tie between tube 31B, bracket 31C and tone arm support bracket 22, thereby directing the horizontal movement of the tone arm during change cycle. Arm control pin 31A slides along track in arm control plate 36, and in so doing, determines the point of landing of the pickup and the point of trip of the mechanism. It also incorporates landing adjusting screw 32.

Arm Control Plate Assembly—36, 36A 36B 36C

Incorporates a track 36B which controls the pickup landing and the tripping of the mechanism.
Stop tab 36A functions as portion of the tripping device, stud 36C, contacting push-off cam 42 controls, the point of landing for both 10- and 12-inch records.

Riser Plate Assembly—37, 37A, 37B, 37C

Provides mounting for eccentric cam 43, and incorporates an inclined track 37C, which controls the vertical movement of the tone arm.
Riser plate tab 37B pushes against curved portion of cam on arm control assembly 31, providing a control for the horizontal movement of tone arm during change cycle.
Riser plate bracket 37A contacting push-off arm 42B provides the necessary motion for push plate 7C.

Eccentric Cam—43

Transfers motion from turntable to riser plate 37 during cycling.

Push-Off Cam and Shaft Assembly—42, 42A, 42B

Provides a means of mechanically coupling tone arm lift 19 and push plate 7 assemblies to main cycling mechanism.
Cam 42B contacting stud 36C controls the position of arm control plate while in cycle, which determines the landing point of the pickup on 10- or 12-inch records.

Turntable Mounting and Guide Rod Assembly—51, 51A

Incorporates the main bearings for the turntable and provides a mounting for guide rods 51A.

MODELS 960260-1, 960260-2

RCA MFG. CO.

ADJUSTMENTS

Tone Arm Adjustment

The tone arm height should be so adjusted as to permit the sapphire to engage and ride in the grooves of one record placed on the turntable, but at the same time prevent the tone arm from touching the records on the supports while the mechanism is going through cycle, fig. 5.

1. With the mechanism out of cycle, lift tone arm and check and make certain tone arm lift 19 engages pin 14 as shown in fig. 6.
2. With the pickup near the edge of the record, loosen the set screw (with Bristo Wrench #6), holding collar 10, fig. 9, and moving it up or down on shaft 42A, so as to have the conditions indicated in sketch, fig. 5.

Preliminary Landing Adjustments

An accessible landing adjustment screw 32 is provided, but if for any reason the tone arm support bracket has become loose or removed, proceed as follows:

1. With the mechanism out of cycle, turn adjustment screw 32, fig. 8, clockwise as far as it will go, then turn counterclockwise two or three full turns.
2. Set head assembly for 12-inch position; place a 12-inch record on turntable.
3. Press down on the reject button and rotate the turntable by hand, causing the mechanism to cycle until the pickup is about to land on the record. In this position, the arm control pin 31A is in a position on track 36B as indicated by "s" and adjustment screw 32 remains against bracket 31C as indicated in fig. 8.
4. Loosen the two set screws holding the tone arm support bracket.
5. While holding this position, place the sapphire in the starting groove of the record, and tighten two set screws in the tone arm support bracket.

Final Landing Adjustment

The exact landing adjustment can be made by pressing the reject button and rotating the turntable by hand until the pickup is about to land. Then turn adjustment screw 32, fig. 8, until the sapphire is directly above the starting groove of the record. If the mechanism continues to land incorrectly after this adjustment has been made, compensate the difference by turning the screw 32 slightly. Turning screw counter-clockwise will move the landing towards the center post.

Positioning Push-off Arm

1. With the mechanism out of cycle, turn the push-off cam to such a position, so that the arm makes a 90° angle with the slide bars as shown in fig. 10. Make certain the large radius side of cam is toward the stud 36C when the support post is in the 12-inch position.
2. Place push-off arm 5 over push-off cam shaft 42A, and engage push-off plate pin 7A near the top edge, fig. 7. Tighten set screws.
3. Press down on reject button and rotate the turntable slowly by hand, making certain push plate does not reach its limit, or push-off arm does not come down against push plate when the riser plate is in its outermost position. If push plate should reach limit, or push-off arm should come down against push plate before riser plate reaches its outermost position, back-off either one until corrected.
4. Check this for both 10- and 12-inch setting.

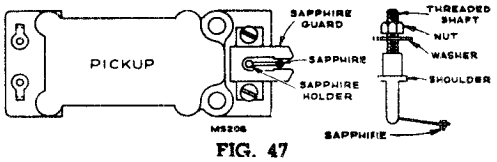

FIG. 47

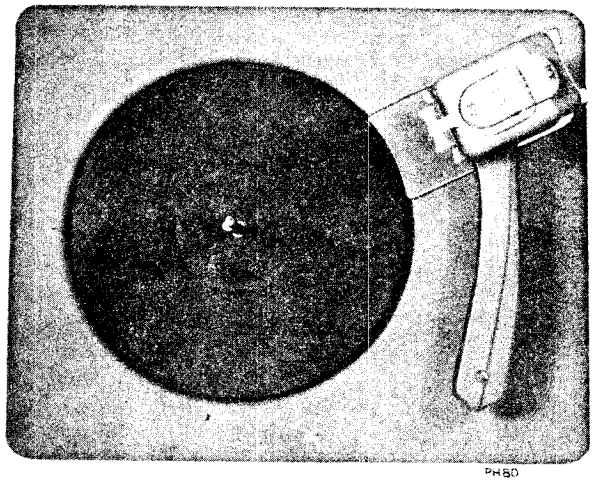
Caution: Never bend the sapphire support wire.

The nut on the sapphire holder assembly is locked by a light cement (such as Glyptal). Extreme care should be used when loosening the nut so that the twisting motion does not break the crystal.

Remove the two screws holding the sapphire guard in place and remove guard. Remove the small nut and washer on the threaded shaft of the sapphire holder and gently push the shaft through the hole in the armature shaft until the sapphire holder assembly comes free.

Use of a drop or two of acetone will facilitate the removal of the nut and shaft. Do not use force as the crystal may be broken.

Insert threaded shaft of replacement sapphire holder through armature shaft and replace the washer and nut. Make sure that the sapphire is in the correct position. Take hold at the lower end of the shaft with a pair of pliers while tightening the nut, being very careful so as not to strip the threads or break the crystal. Replace the sapphire guard, positioning it by means of the oversize screw slots. Make certain that the sapphire and its supporting wire are centered in the guard. Tighten the guard screws. Before using, check to see that the sapphire projects far enough (approx. .020) beyond the guard so that the guard will not strike the record. If necessary, bend the guard a little. Apply a drop of light cement (such as Glyptal) to the sapphire nut holder.



PH50

NOTE: The major difference between the two models is the addition of an "Off-On" switch on the motorboard on Model 960260-1.

Features

1. This mechanism is designed to play automatically a series of twelve 10-inch or ten 12-inch standard records of the 78 r.p.m. type.
2. It will play manually records up to 12 inches in diameter.
3. Tripping system is of "constant diameter" type, insuring reliable automatic operation on all records made to RMA proposed standards.
4. It is a simple operation of turning one record support to change from 10- to 12-inch records or vice versa.
5. Cycling mechanism is disconnected completely while records are being played. This reduces the load on the drive motor, thereby reducing the tendency for "wow" or rumble.

Manual Operation

1. Rotate the record separator shelf clockwise for 10-inch or counterclockwise for 12-inch position (numerals 10 or 12 pointing towards center post).
2. Place the record to be played on the turntable and turn the power switch on.
3. Place the pickup on the start of the record.

   Note: The mechanism should be allowed to complete cycle before attempting to move tone arm to the rest position.
4. Turn power switch off manually.
5. Remove the record by raising straight up without tilting.

Automatic Operation

1. With the power switch in the off position rotate the record support shelf as required for 10- or 12-inch records until the record size indicated on the support cover is pointing toward the center post. (Rotate clockwise for 10-inch and counterclockwise for 12-inch records.)
2. Place the records to be played in a stack with desired selections upward and in proper sequence with the last record on top. Load them on the changer by placing them over the center post and resting on the record support shelf. Place record stabilizing clip on top of the record stack.
3. Turn power switch on and press down firmly but momentarily on the end of the tone arm and let go. The changer will continue to play one side of the entire stack automatically.

   The tone arm can be moved to the rest position any time the mechanism is not in cycle.
4. Turn the power switch off and remove the stack from the turntable by placing fingers of both hands directly opposite and under the stack. Then lift straight up—"don't tilt" or squeeze stack. Turning the support shelf one-fourth turn facilitates removal of records.

Cautions

1. Avoid handling the tone arm or rotating record support assembly while mechanism is in cycle.
2. Never turn the power switch off, leaving the mechanism in cycle for an extended period of time.
3. Do not allow the records to remain on supports when not in use.
4. Do not allow oil or grease to come in contact with any rubber parts.
5. Do not install instrument near source of heat. Excessive heat may damage the pickup cartridge.

	71180	Spring—Drive idler wheel tension spring for motor stamped 407B2
	71185	Spring—Drive idler wheel tension spring for motor stamped 407B3
		NOTE: When replacing complete motor, order RCA 71183
60	71183	Motor—Motor complete with drive idler (57), tension spring (59), mounting grommets (62), shaft bushing (60A), mounting bracket (60B), less power cord
60A	71186	Bushing—Motor shaft drive pulley for motor stamped 407B3
61†	—	Washer—Motor mounting washer
62†	—	Grommet—Motor mounting grommet
63†	—	Screw—Motor mounting screw
64	30870	Plug—2-prong male plug for motor cable
65*	72488	Escutcheon—"On-Off" switch escutcheon for 960260-1
66†	—	Washer—Used in mounting support (51)
67†	—	Screw—Used to mount support (51)
68†	—	Terminal—Pickup lead terminal strip
69†	—	Bracket—Base mounting bracket
70†	—	Screws—Mounting screws for bracket (69)
71	39386	Cable—Shielded output cable with pin plug
72	31048	Plug—Pin plug for pickup cable
73*	72487	Switch—"On-Off" switch for 960260-1
74†	—	Screw—Mounting screw for switch (73)
75*	72482	Lever—Reject lever
76†	—	Spring—Reject lever spring
77*	72484	Plate—Reject mounting plate and arm
78†	—	Screw—Reject lever mounting screws
79*	72483	Wire—Reject trigger wire

* This is the first time this Stock No. has appeared in Service Data.

† These parts are not stocked.

CYCLE OF OPERATION

Turn record support to 10- or 12-inch position as desired and place a stack of records on supports.	1. Turning record support positions the push-off cam 42B through the linkage of push-off arm 5 and push-off shaft 42A. In so doing it determines the distance of movement of control plate 36 which governs pickup landing.
Reject button.	1. Press down on tone arm; this actuates reject button on which it is resting. 2. Reject button actuates reject lever. 3. Reject lever transfers action to reject latch 77A through coupling wire 79. 4. The unlatching of reject latch allows eccentric cam 43 to be pulled against rotating knurled roller 53 which starts cycle.
Record plays.	1. While the record is being played and the tone arm moves toward the center of the record, the arm control pin 31A on arm control assembly 31 moves along track 36B as designated by "P," fig. 13. 2. As pickup moves into trip groove on record, tone arm control pin 31A moves into recess in control plate 36 at point indicated by "T," fig. 13. 3. Trip spring 35 pulls arm control plate 36 towards center post 27, and in so doing allows stop tab 36A on arm control plate 36 to stop catch 43A on eccentric cam 43.
Cycling starts.,	1. Spring 44 pulls eccentric cam 43, causing rubber tire 47 to engage rotating knurled roller 53. 2. Eccentric cam 43 mounted on riser plate transfers energy to force the riser plate assembly back along the guide rails 51A away from center post 27. 3. As riser plate moves, the push-off cam and shaft assembly 42 rides along the inclined track 37C of the riser plate 37. 4. This action results in the push-off cam and shaft assembly 42 being pulled down.
Tone arm raises and moves out.	1. The tone arm lift 19 sliding on shaft 42A is pulled downward, contacting lift bearing pin 14, and causing tone arm to raise and clear record. 2. The riser plate tab 37B contacting curved portion of arm control assembly 31, which is coupled to tone arm support bracket assembly, causes the tone arm to be moved outward away from, and clears the edge of the records. Arm control plate is also being carried along by tab 37B contacting spring 34.
Record is separated and drops to turntable.	1. As riser plate 37 continues to travel further along guide rods 51A, the riser plate motion bracket 37A contacts and rotates the push-off cam and shaft assembly 42. 2. Push-off arm 5, being coupled to push-off cam and shaft assembly 42, is rotated, causing push plate 7C to push record off of projection on center-post and dropping it to the turntable. **Note:** The small separator latch 27A in the end of the center post functions as a thickness gauge, allowing only one record to be pushed off the projection at one time.
Mechanism continues to cycle, returning tone arm and positioning it for landing.	1. As eccentric cam 43 is returning to minimum diameter (out of cycle position), riser plate is being pushed back to normal position by recoil spring 38. At the same time, the push plate spring 8 is pushing the push plate 7C and push-off arm 5 back to normal position. 2. The portion of arm control assembly mounting the control pin 31A, and the control bracket 31C, are hinged on the plate forming part of assembly 31. Since the pin 31A has followed the track 36B and the curved portion of bracket 31C was forced out by motion of tab 37B, the tension of spring 30 is tending to pull them together as the riser plate is returning to normal position. The governing factor in determining how far the bracket will be pulled in, is the setting of the landing adjustment screw 32.
Pickup lands.	1. During part of the change cycle when riser plate was in the outermost position, and carrying arm control plate along by tab 37B contacting spring 34, the stud 36C is stopped by cam 42B. This acts as a gauge to determine the point of contact of pin 31A on arm control track 36B. This cam having two different radii will govern the distance arm control plate can travel since this is set when the record size change is made. If the smaller radius side of cam 42B is toward stud 36C, the arm control pin 31A will ride portion of track 36B designated by "L", causing the pickup to land on 10-inch records. On the other hand, if the larger radius portion of cam is toward the stud, the pin will ride along track designated by "S", which determines landing point on 12-inch records.

Instructions
AUTOMATIC RECORD CHANGER

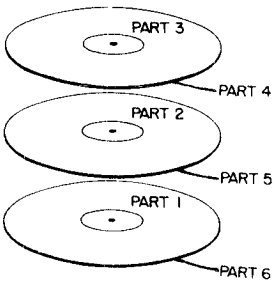
LOAD. Lift and turn both Selector Arms for 10 or 12 inch records as desired (Arrows pointing *directly* at spindle). Load changer with up to fourteen 10 inch records or up to ten 12 inch records, not intermixed.

START AND STOP. Turn radio switch "ON" and set Radio-Phono switch to "PHONO". Move Control Knob to "REJECT" and release it. The changer will now play the entire stack and keep repeating the last record until shut off. (To shut off before entire stack has been played move Control Knob to "OFF', lift Tone Arm and move out to Rest Position.)

UNLOAD. Move Control Knob to "OFF". Remove unplayed records on Selector Arms. Lift and turn Selector Knobs until Arms clear the records. Remove records from Turntable. The changer can now be reloaded as described above.

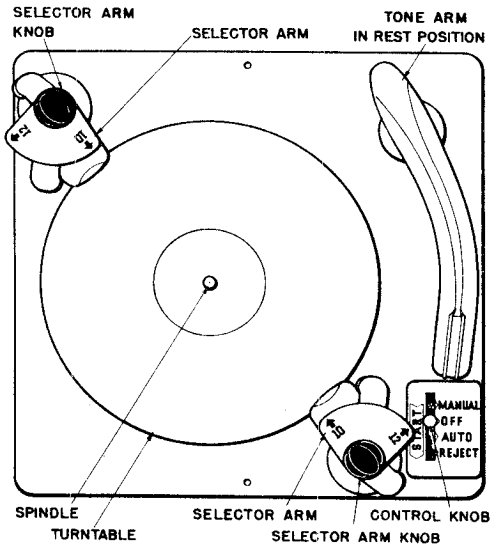
REJECTING A RECORD. To reject a record before it has finished, move Control Knob to "REJECT" and release it. The changer will reject that record and continue to play the remainder of the stack.

RECORD SEQUENCE (Automatic playing). Complete operatic or symphonic works usually require two or more records. When ordering such records, specify that they are for a "Drop Type" changer and arrange them in the sequence illustrated. Example:



A 3 record-6 part recording. After parts 1, 2 and 3 have been played, turn the stack over and the remaining half will be in proper sequence.

MANUAL OPERATION. Odd-sized or very old records and home recordings should be played manually. Lift and turn Selector Knobs as for unloading. Place record on turntable. Move Control Knob to "MANUAL" position. Place tone arm on record and when finished playing return by hand to rest position. To stop, move Control Knob to "OFF" position.



CARE OF RECORDS. Wherever possible, records should be kept in albums and away from domestic heating units. Remove records from changer when through playing. Remove dust with a soft, dry cloth.

PHONOGRAPH NEEDLES. Any needle that is designed to play fifteen or more records can be used. It is more economical to purchase a needle rated at 1,000 plays or more. Do not exceed the maximum allowable plays on such needles.

HELPFUL HINTS.

POOR TONE QUALITY—EXCESSIVE NEEDLE SCRATCH is usually due to a damaged or worn needle or record. Replacing either, or both, is the obvious remedy.

RECORD CATCHING ON SELECTOR ARMS may be caused by using defective or badly warped records. These should be played manually.

SLIPPING ON TURNTABLE is caused by a warped record that does not present enough contact surface to the record below it, producing an uneven sound.

©John F. Rider

©John F. Rider

LUBRICATION applied at the time of manufacture is usually sufficient for several years of normal operation. If, after a prolonged period, there is reason to believe that further oiling is necessary, it is recommended that you consult your dealer.

SQUEAKS AND CHAFING NOISES can be corrected by aligning unplayed records on the spindle.

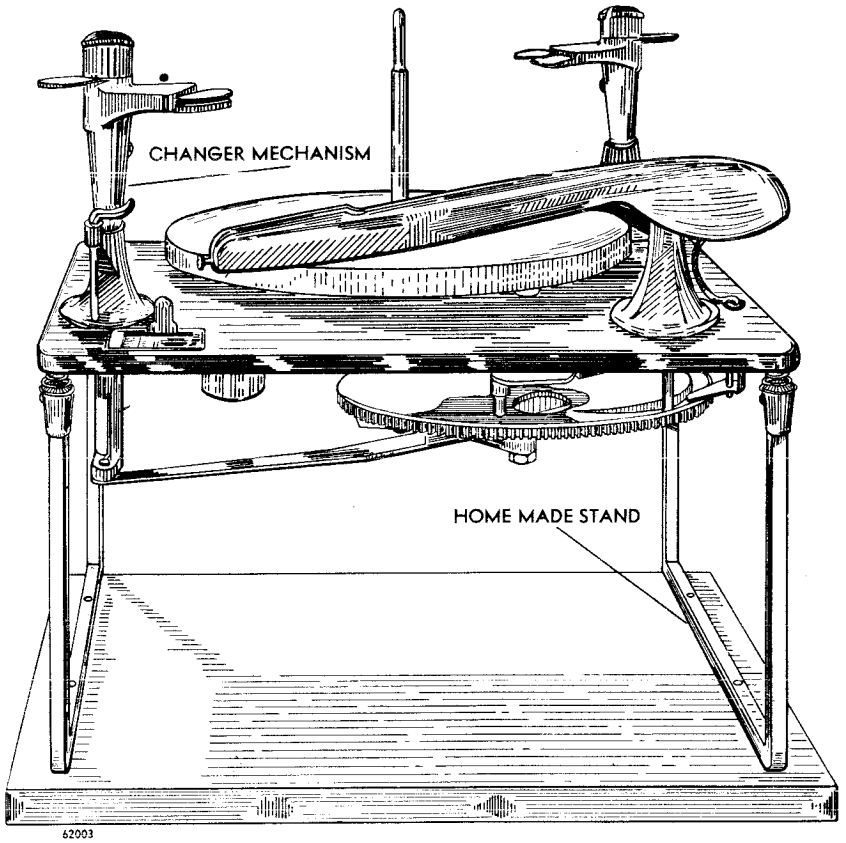


FIGURE 3.

A home-made work stand, indicated above, permits easy access to all parts of changer mechanism.

I CYCLE OF OPERATION

After placing changer in operating position, with records on the selector arm posts, the control knob governs all subsequent automatic operations.

A. CONTROL SLIDE—Moving the control slide from "OFF" to "REJECT" starts the changer into "AUTOMATIC" operation in three steps:

1. As the control slide moves from "OFF" past "AUTOMATIC", slot "a" in the control slide (1) turns on the power switch (2) starting the motor and turntable.

2. When the control knob reaches "reject", the changer is manually "tripped" as follows:

The control slide pushes connecting link (3), moving the reject slide (4) in direction of arrow. Surface "b" strikes trip lever stud "c". Trip lever (5) movement releases the clutch engagement lever (6). (Levers 5 & 6 are mounted on drive gear (8).

3. When the control knob is released, it returns from "REJECT" to "AUTOMATIC".

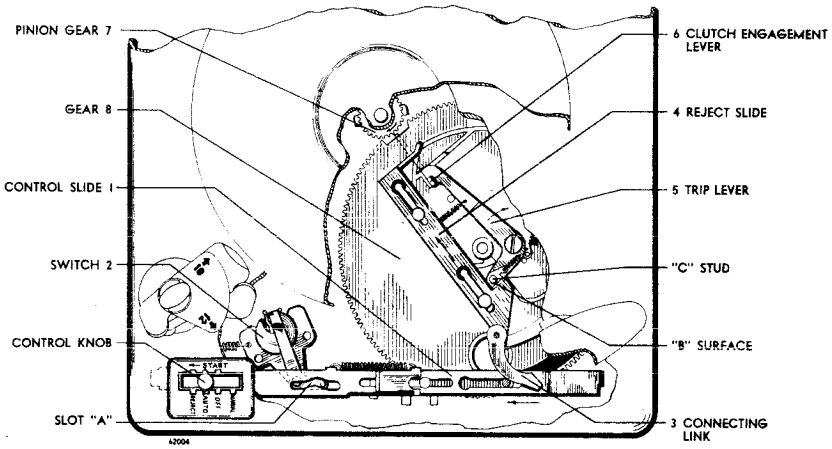

FIGURE 4. CUT AWAY TOP VIEW

©John F. Rider

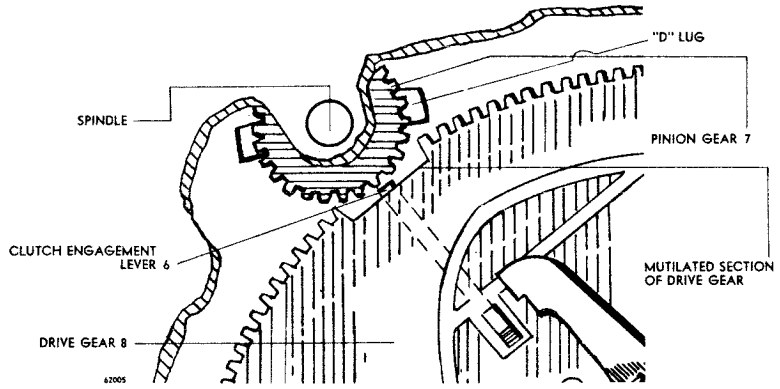

FIGURE 5. CUT AWAY TOP VIEW

B. CLUTCH ENGAGEMENT Lug "d" on the rotating pinion gear (7) strikes extended portion of clutch engagement lever (6) causing drive gear (8) to rotate and mesh with pinion gear (7). (Open tooth or "mutilated" section of drive gear (8) permits pinion gear (7) to rotate freely, EXCEPT during change cycle.)

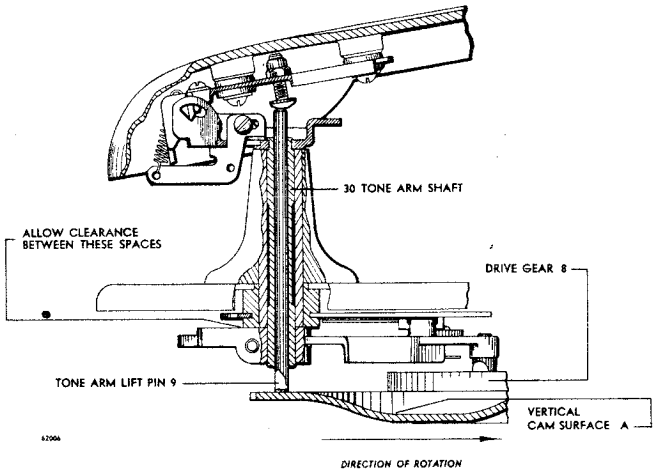

FIGURE 6. CUT AWAY SIDE VIEW

C. ROTATION OF DRIVE GEAR (8) results in the following cam actions:

1. Vertical cam "e" moves the tone arm lift pin (9) and raises the tone arm.

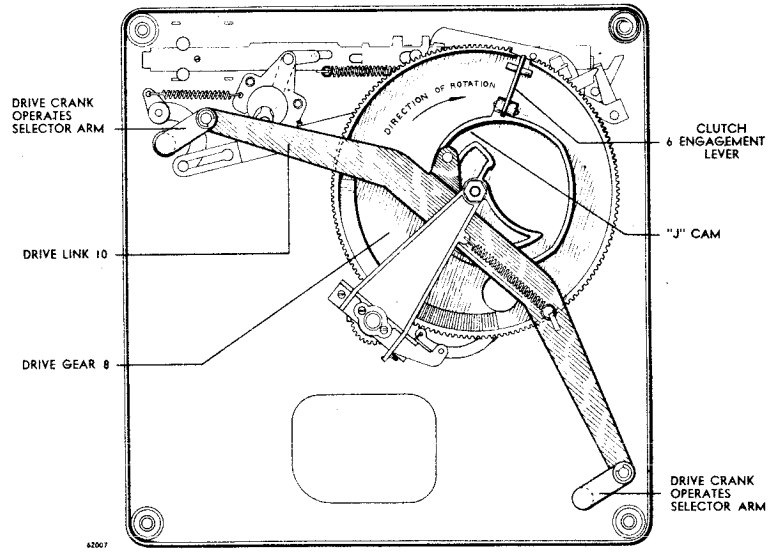

FIGURE 7. BOTTOM VIEW

2. Cam "J", (bottom surface of drive gear) actuates the drive link (10) that induces the quarter turn by which the selector arms release a record.

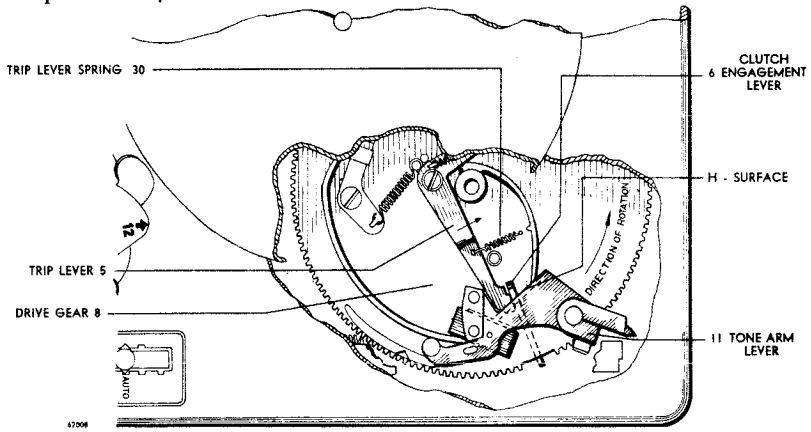

FIGURE 8. CUT AWAY TOP VIEW

3. Surface "h" on the locked tone arm lever (11) resets the trip by latching the clutch engagement lever (6) to the trip lever (5).

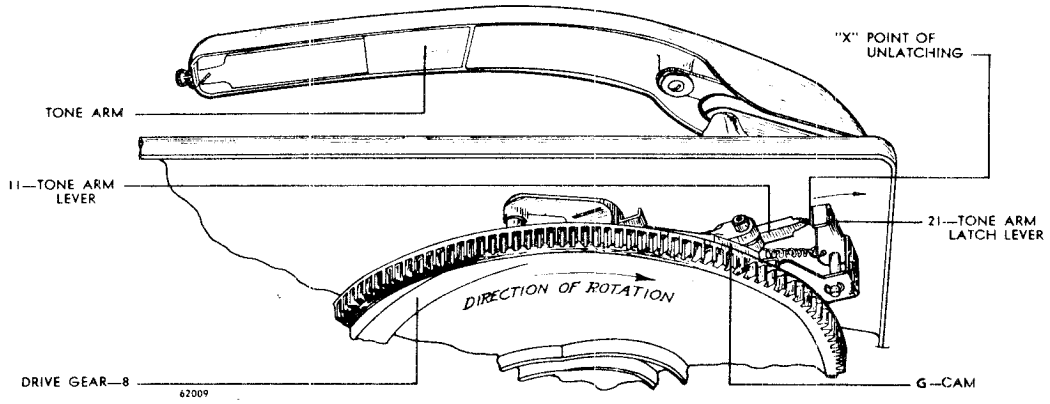

FIGURE 9. BOTTOM VIEW

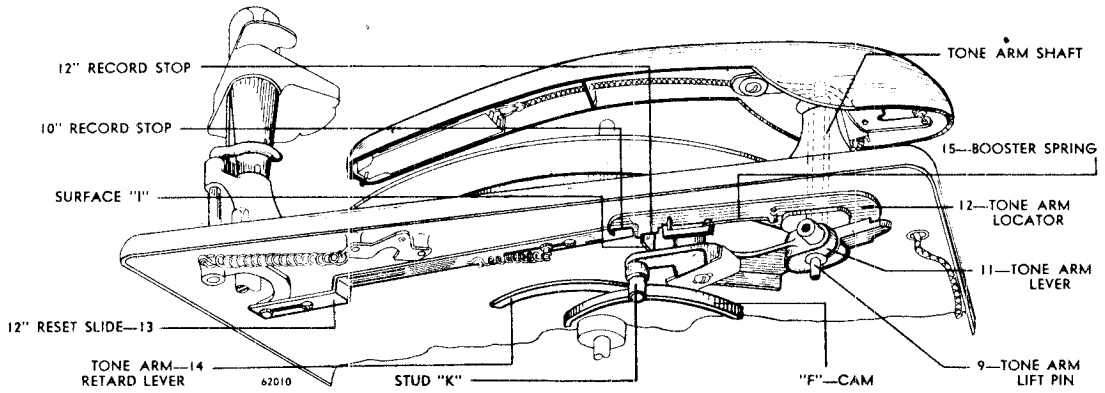

FIGURE 10. CUTAWAY BOTTOM VIEW DRIVE GEAR

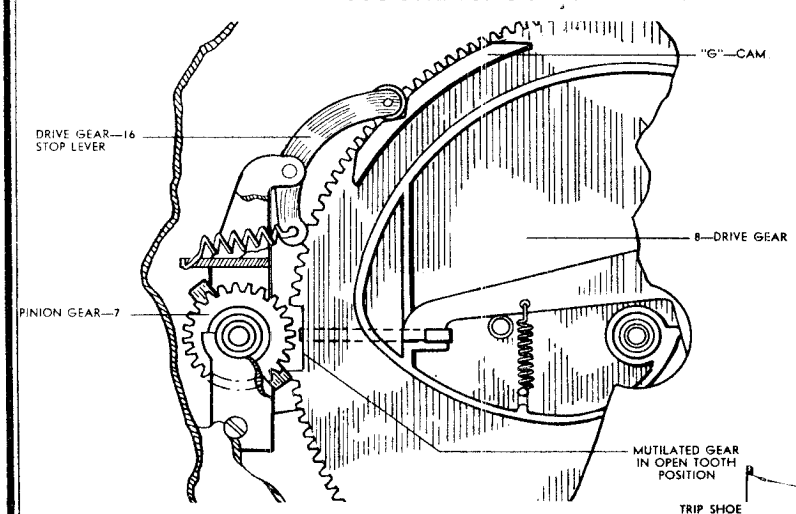

FIGURE 11. CUT AWAY TOP VIEW

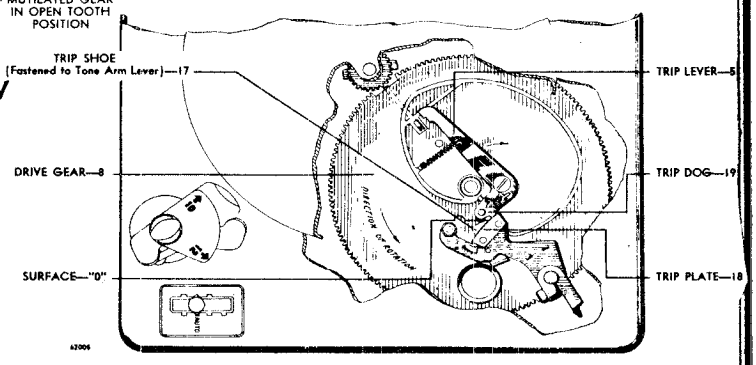
FIGURE 12. CUT AWAY TOP VIEW



©John F. Rider

©John F. Rider

4. Cam surface "g" moves the tone arm latch lever (21) so as to unlatch the tone arm lever (11) at point "x". Thereafter the stud "k" on the tone arm lever follows the receding cam "f", shown in figure 10.

5. Spring pressure from tone arm locator (12) moves the tone arm lever (11) and tone arm toward the record. Selector arm settings determine the point at which the tone arm locator (12) stops at surface "i" on the 12″ reset slide (13). Sketch above shows 10″ and 12″ record stops.

6. Stud "k" is contacted by the retard lever (14) holding it in position during the time of lowering the needle on the record. (See retard lever.)

7. Tone arm lift pin (9) follows vertical cam on drive gear and lowers tone arm to the record. After the needle has touched the record, booster spring (15) exerts a slight pressure, causing the needle to enter starting groove.

8. As the needle starts in the groove, drive gear (8) completes its rotation and is locked in open-tooth position by the drive gear stop lever (16) in detent in cam "g".

D. AUTOMATIC TRIPPING—At the end of a record, the needle enters the cut-off groove and a new change cycle is set in motion by either of two actions releasing the clutch engagement lever (6).

1. MINIMUM DIAMETER CUT-OFF occurs when trip shoe (17) strikes trip lever (5) at point "o".

2. ECCENTRIC GROOVE CUT-OFF occurs when the tone arm is moved away from the spindle. The sawtooth edge of the trip plate (18) engages and moves the trip dog (19), causing the trip lever (5) to function.

The changer has now completed one cycle of automatic operation.

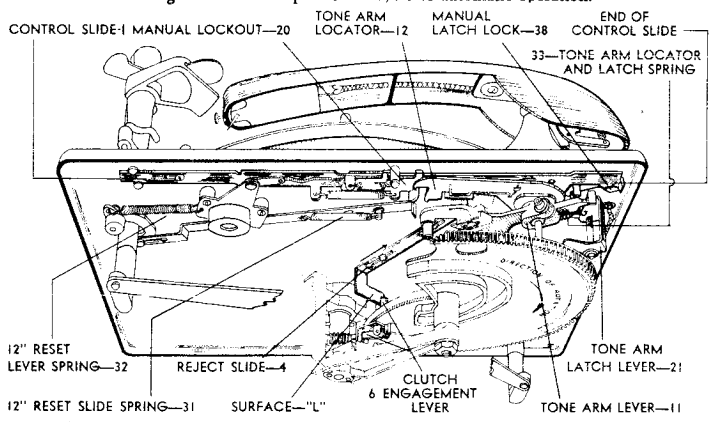


FIGURE 13. BOTTOM VIEW

II MANUAL OPERATION

With the control knob in "MANUAL", the control slide (1) sets up 4 conditions:

A. Motor switch is on.

B. The end of the control slide (acting through the manual latch lock (38) partially disengages the tone arm latch lever (21) from its locked position. It now serves as a detent for the tone arm while in rest position and prevents its movement due to accidental bumping.

C. The manual lockout (20) on the control slide prevents the tone arm locator (12) from moving inward, thereby permitting free movement of the tone arm by hand.

D. The reject slide (4) is in position so that surface "1" holds the clutch engagement lever (6) and prevents tripping.

III DETAILED DESCRIPTION OF CERTAIN FUNCTIONS AND PARTS

A. TONE ARM LATCH LEVER (21)

1. *Functions and Positions:*

a. A positive lock for the tone arm when the latter is swung to the outside of the panel in all positions of the control slide other than "MANUAL". This is brought about by the engagement between the tone arm lever (11) and the tone arm latch lever (21).

b. A partial lock, or detent, for the tone arm while the control slide is in "MANUAL". This results when the control slide is moved to the "MANUAL" position. The back edge of the control slide strikes the manual latch lock (38), which in turn moves the tone arm latch lever (21).

c. Complete disengagement results through the cam "g" on the outside edge of the drive gear during the Automatic change cycle. It is this unlatching action which puts the tone arm back into AUTOMATIC operation when the control slide is moved to the REJECT position.

2. *Actions*

a. When the tone arm is playing a record in "AUTOMATIC" position and is moved to the rest position, the tone arm latch lever (21) must positively lock the tone arm lever (11).

b. When the control slide is moved to "MANUAL" the turned down portion of the control slide must contact the manual latch lock (38) which pulls the tone arm latch lever (21) and changes its contact with the tone arm lever (11) from a positive lock to a partial lock, giving a light, smooth detent action when the tone arm is in the rest position. (See Fig. 13)

J. P. SEEBURG CORP.

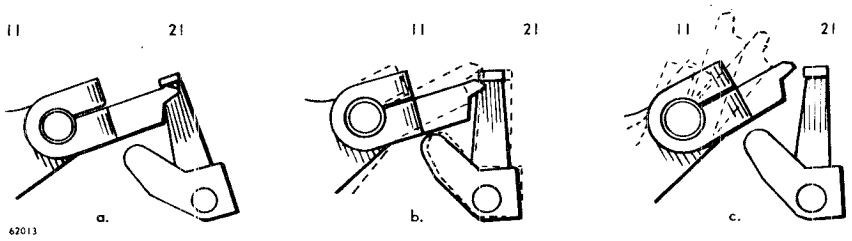

FIGURE 14.

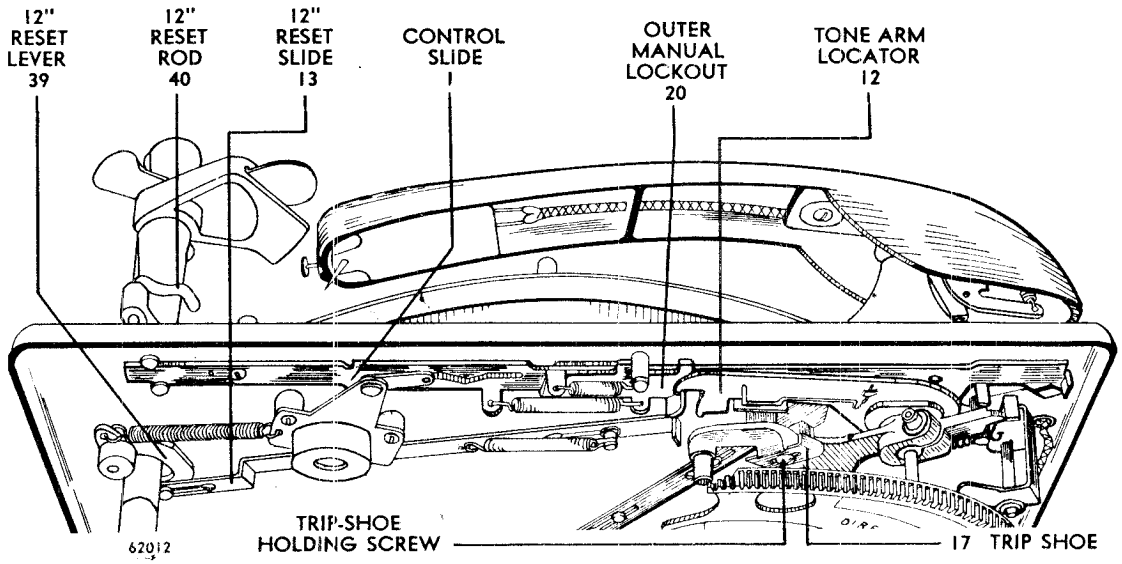

FIGURE 15. CUTAWAY BOTTOM VIEW

B. MANUAL LOCKOUT ASSEMBLY (20) engages and retains the tone arm locator (12) in its outermost position while the control slide is set in the "MANUAL" position. There are three actions involved:—

1. When the tone arm is in the rest position, and the control slide is moved into MANUAL, the outer manual lockout (20) moves to hold the tone arm locator from moving inward.

2. The manual lockout (20) and the tone arm locator (12) must remain engaged, while the control slide is moved into any other position, until automatically released by the Drive Gear Cam.

3. With the tone arm lever in "MANUAL" position the manual lockout will slide back and allow the lockout engagement described in "1" above if the tone arm is being moved into the rest position.

C. 12" RESET SLIDE (13), 12" RESET LEVER (39), AND 12" RESET ROD (40) indexes the tone arm properly for a 10" or 12" record, depending upon the setting of the selector arm. This is accomplished by transmitting the motion (due to the reset rod contacting the smooth surface or the rib) on the selector arm to the 12" Reset Lever. (See Fig. 14

©John F. Rider

©John F. Rider

D. TONE ARM RETARD LEVER (14).

1. Maintains a light pressure outwards during that part of the cycle after tone arm lever (11) leaves the cam surface of the large gear. The purpose is to prevent overswinging of the tone arm and hold it at the radius previously determined by the locator lever (12) immediately prior to and during the time of lowering the needle on to the record.

2. Prevents action of the booster spring (15) until such time as the needle has actually landed on the margin of the record.

EXCESSIVE TENSION on the tone arm retard lever spring (26) would tend to cause a jerky motion of the tone arm during the part of the cycle described in "1" above. Extreme tension might even cause incorrect indexing by not allowing the tone arm to go into the proper diameter as determined by the locator lever (12).

INSUFFICIENT TENSION on the retard lever spring (26) would result in a premature booster spring (15) action so that the needle would land inside the margin of the record. Extremely weak pressure, or no spring pressure at all, would result in an overswing of the tone arm causing the needle to land some place in the middle of the record.

E. BOOSTER SPRING (15)—Its purpose is to move the needle into the first playing groove on records which do not have a lead-in groove. Booster spring pressure is correctly adjusted when it causes the needle to move from the index point to the starting groove and no further. Excess pressure may cause the needle to scrape across the first few grooves. See tie in with retard lever action.

F. TONE ARM KNIFE EDGE HINGE In order to reduce vertical friction of the tone arm to a minimum as required for best operation with light pressure pickups, the hinge bracket is of the knife edge type. A hardened steel knife edge "m" seats, under spring (24) pressure, into v's, "n", in the lower bracket.

1. The knife edge must not be broken or damaged.

2. There must be a slight amount of sidewise play between the bracket and the lower part of the knife edge shoulder, and also between the brackets themselves.

NOTE:

Side clearance of the knife edge shoulder "p" in its bracket will give correct performance during playing since the knife edge is held solidly seated in the bracket by a spring. Also the movement of the knife in the bracket, when the arm is handled manually, has no significance since the knife edge reseats itself due to the spring action when released.

3. INCORRECT SIDE PLAY OR CLEARANCE

a. Insufficient sidewise play will result in rubbing or vertical friction.

b. Excessive clearance will result in erratic tone arm landing and cut-off operation, since the whole arm may shift slightly during the change cycle.

G. HOW TO REMOVE TURNTABLE

It should be removed, by lifting *carefully*, tapping spindle *lightly* if necessary. This will expose top spindle bearing. When replacing turntable, slot in hub (28) must seat properly over spindle pin. (Rotate 180° for best fit). Push idler wheel in while lowering, so rubber rim will not be damaged by turntable edge.

IV ADJUSTMENTS

A. MOTOR FAILURE, *possible causes:*

1. Power supply off, worn or broken wire, or defective plug.

2. Faulty switch.

3. Linkage between switch and control slide.

CAUTION: The control slide must operate an over-center action of the switch when it is moved *slowly* in either of the positions adjacent to "OFF".

4. Burned out, or open motor coils.

B. MECHANICAL BINDS

1. During change cycle:

a. Rotate turntable by hand, clockwise.

b. If it seems to bind at one point only, examine the drive and pinion gears for foreign matter between the teeth.

c. Examine the turntable spindle and selector arm bearings for lack of lubrication.

2. During playing cycle: Idler wheel slide should move freely and its spring tension must be positive so that idler wheel maintains constant contact with turntable rim and motor shaft.

CAUTION: Excessive tension on this spring will cause rapid wear of idler wheel and "rumble" when playing.

J. P. SEEBURG CORP.

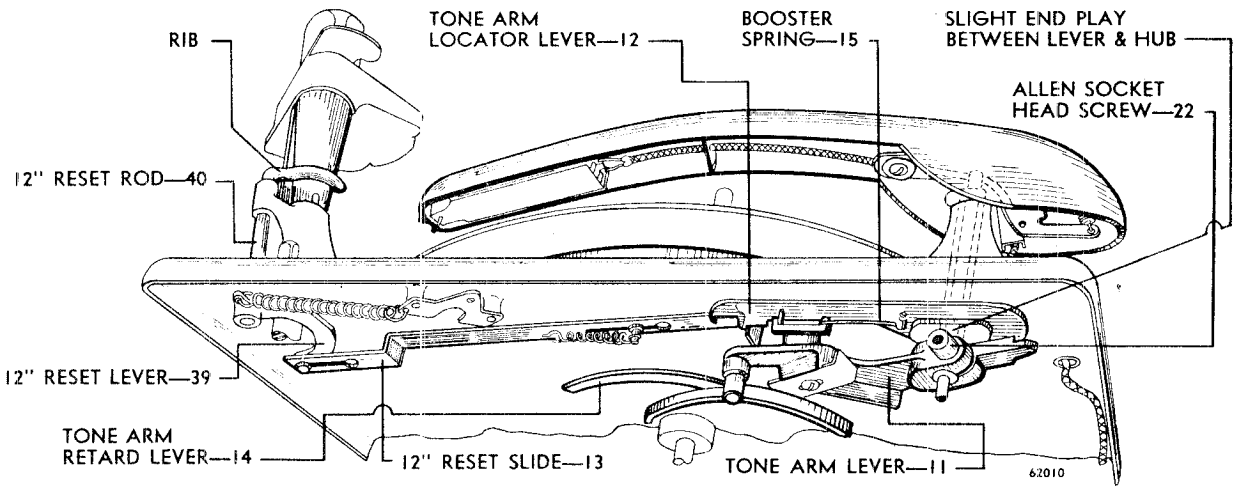

FIGURE 16. BOTTOM VIEW

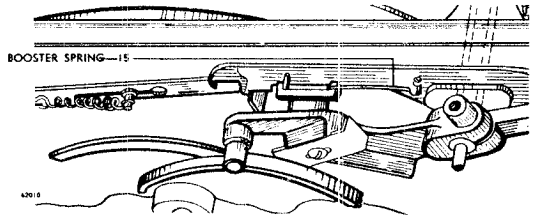

FIGURE 17. BOTTOM VIEW

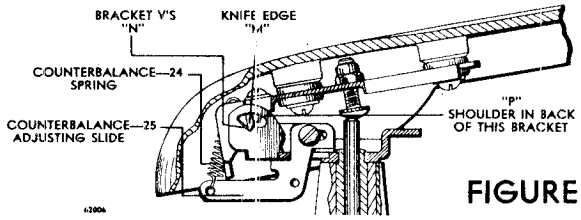

FIGURE 18. CUTAWAY END VIEW

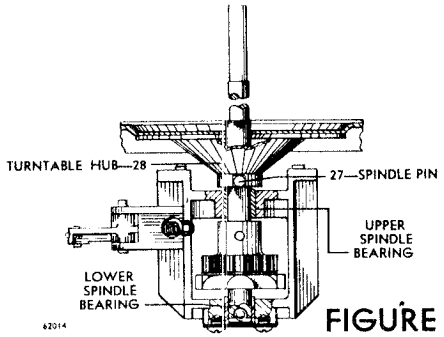

FIGURE 19. CUTAWAY SIDE VIEW

©John F. Rider

©John F. Rider

C. MECHANICAL JAMS—Shut off power and proceed as follows:

1. Rotate the turntable counter-clockwise slightly. This should free it.
2. Examine the mechanism for loose, bent parts or foreign matter.
3. A bent clutch engagement lever (6) will cause a failure in the meshing of drive and pinion gear teeth at the start of a change cycle.
4. As a further aid, it is recommended that the text and sketches, starting with Fig.4, be studied.

D. RECORD JAMS *are caused by:*

1. Selector arms improperly set.
2. Odd-sized, badly warped or damaged records. Play these in "MANUAL" position.
3. Selector blades damaged or improperly adjusted. See next page.

E. RECORD DROPS ON ONE SIDE ONLY if it has an unusually large center hole or a broken edge. Also examine the mechanism for a bent spindle or selector arm post, due to rough handling.

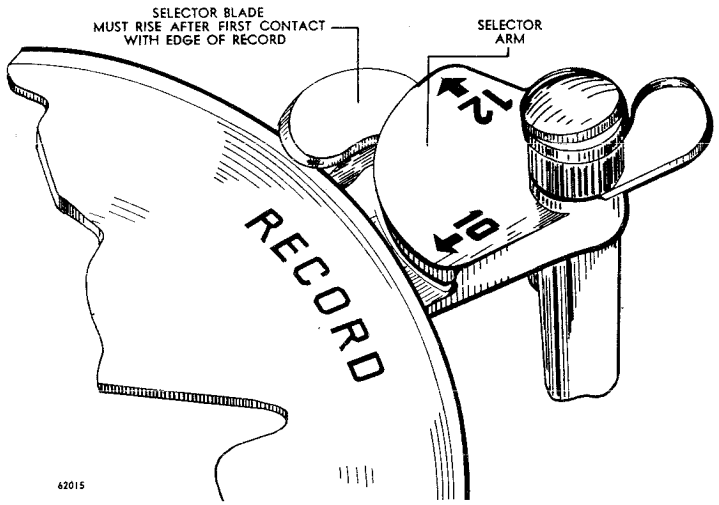

FIGURE 20. TOP VIEW

F. SELECTOR ARMS AND BLADES

1. BLADE ADJUSTMENT *(see fig. 20)*

a. If an adjustment is necessary, place a 10″ record of average thickness (.074″) on the selector arms and manually rotate the turntable clockwise until the selector blade contacts the record. The blade must rise after it first contacts the edge of the record. This rising cam action results whenever pressure is applied to the leading edge of the selector blade. The blade may be adjusted by bending, very slightly, to correct position (use pliers with tape lined jaws). The height to which blades are set must be less than the minimum record thickness, otherwise the blade will attempt to change two records at a time, due to the cam action which *always* operates in an *up direction*. When necessary, make the same adjustment on the 12″ selector blades, using a 12″ record (approximately .090″ thick).

b. The leading edge of blade must be smoothly rounded and well polished.

c. Blade must be very free in its mounting so that it will return to normal position by its own weight.

2. SELECTOR ARMS must be parallel with each other, and must be synchronized so that a record will drop evenly onto the turntable.

G. INCORRECT TONE ARM INDEXING

1. Study the text concerning Fig. 13. Examine the following two springs for being loose, of improper tension or missing: 12″ Reset Slide Spring (31), 12″ Reset Lever Spring (32).
2. Incorrect Locator Spring Tension (33)

a. Insufficient spring tension will produce erratic or incorrect tone arm landing since the locator will not seat in the fixed 10″ or 12″ indexing position. (See page 8) It will also result in a jerky action of the tone arm, since the tone arm lever will not accurately follow the cam surface of the large gear.

b. Excessive spring tension will result in a stiff, heavily loaded "feel" as the tone arm is moved into the rest position. It may also produce a stiff action of the control slide (when the manual lockout is engaged) and cause increased wear on moving parts.

3. Tone arm retard lever (14) binds. Examine its pivot point for foreign matter between gear casting and shoulder screw. Also, examine retard lever spring (26) for proper action. (See Fig. 16.)
4. EXCESSIVE CLEARANCE at tone arm hinge bracket. (See Fig. 18.)

©John F. Rider

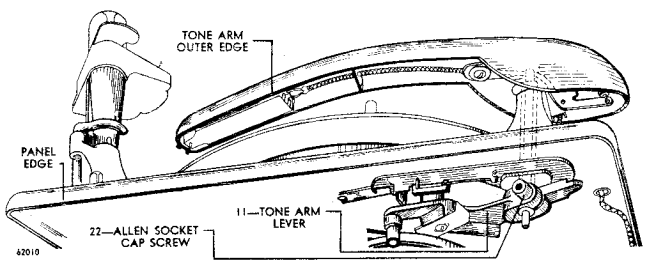

FIGURE 21. BOTTOM VIEW

H. TONE ARM POSITIONING *is as follows:*

Note: Before attempting the following procedure in order to correct tone arm landing, check previous page, since any one of these reasons may be the actual cause of incorrect landing.

1. Set the control knob in the "OFF" position (power plug out).
2. Place a 10" record on the turntable and set the selector arms (10" arrows pointing directly at the spindle).
3. Loosen the Allen socket cap screw (22) just enough to allow the tone arm lever to still hold its position.
4. Line up the tone arm's outer edge evenly with the panel edge. This gives the tone arm an approximate setting.
5. Push the control knob to "REJECT" and release it. Rotate the turntable clockwise and observe where the needle first touches the record. This should be about one-eighth inch from the edge. Variations should be corrected by slipping the tone arm lever (11) in the correct direction.

Caution: Before tightening the Allen screw, make certain that there is enough vertical clearance in the tone arm shaft to avoid binding while the tone arm swings.

6. Replace the 10" with a 12" record and set selector arms accordingly. If the 10" adjustment was made correctly, the 12" indexing should be automatically correct.

I. TONE ARM HEIGHT *adjustment:*

1. The height to which the tone arm rises is correct when there is an approximate 1/16" clearance between it and the bottom of a 10" record on the selector arms. This clearance is regulated by the tone arm adjusting screw (23).

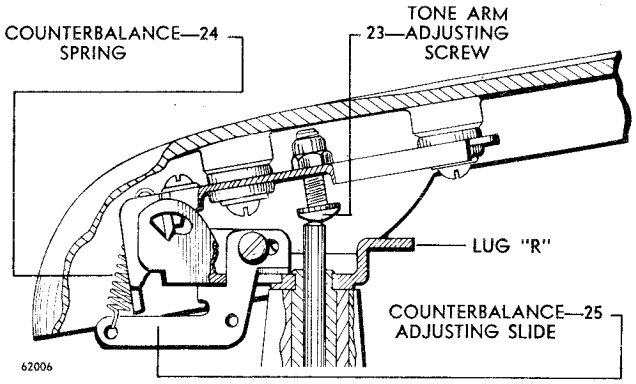

FIGURE 22. CUTAWAY SIDE VIEW

2. The down position of the tone arm is fixed by lug "r" on the tone arm hinge assembly. The correct height is that which will allow the bottom edge of the tone arm and cartridge to clear the turntable surface by approximately 1/16". This adjustment may be corrected by a slight bend of the lug "r".

J. NEEDLE PRESSURE is controlled by the counter-balance spring (24) in back of the tone arm. The pressure is variable through the counter-balance adjusting slide (25). The needle pressure should not be less than 1-1/8 oz.

K. FAILURE TO TRIP *may be caused by the following:*

1. Old style records without proper cut-off grooves. These should be played in "MANUAL" position.
2. Broken, worn or improper needle which does not follow cut-off groove.
3. Closed-circle trip is incorrectly set. The trip shoe (17) is moveable and loosening its holding screw allows it to be adjusted as required. This adjustment is correct when the needle is 1-7/8 inches from the record center and the trip shoe pushes the trip lever which releases the clutch engagement lever. (See Fig. 15)
4. Tight tone arm lead wire. The shielded wire emerging from the back of the tone arm should be draped so as to permit free movement of the tone arm. Never pull it tight or tie down.
5. The clutch engagement lever (6) not unlatching. This lever has a loose fit at its pivot point and operates by gravity. It is intended to operate dry and must never be lubricated. Keep free from dust and lint. Rotate drive gear 180° from rest position for detailed examination of lever (see fig. 7)
6. Trip lever (5) binding at its pivot point and failing to unlatch engagement lever. Examine for foreign matter between gear casting, lever and shoulder screw.
7. Tone arm binds when moved toward spindle as a result of insufficient vertical clearance for tone arm shaft (30). This is caused by tone arm lever (11) being too close to underside of panel; loosen Allen socket cap screw (22), reset and retighten. (See fig. 6)
8. Trip failure with eccentric cut-off groove records. This can best be analyzed by studying the text concerning Fig. 4.

©John F. Rider

L. REPEATED TRIPPING IS *caused by:*

1. FAILURE OF CLUCH ENGAGEMENT LEVER (6) TO LATCH. With the mechanism stopped in the playing position (pinion in open tooth portion of drive gear), latch the clutch engagement lever with the aid of a pencil and unlatch by moving the control knob to "REJECT". Repeat this several times. If it fails to latch:

a. Examine the trip lever (5) for binds or insufficient tension in the trip lever spring (30). Replacement of a weak spring will give a positive latch-up. Do not increase tension to a point where it will cause a *trip failure.* (See fig. 8)

b. Control knob binding in "REJECT" position due to sticking control slide (1) or its associated levers and springs. Examine for loose or missing springs.

c. Manual reject slide incorrectly positioned so that it fails to clear the trip lever while in "AUTOMATIC" operation.

2. FAILURE OF STOP LEVER to properly detent drive gear. See Fig. 11 Examine for proper spring tension.

M. TURNTABLE SPEED should be checked with a stroboscopic disc under running conditions and with the needle on a record. Slow speed may be produced by lack of lubrication in the spindle bearings (35) or slipping of the idler wheel (36). In the latter case, examine for a weak idler spring (37) or for oil in the rubber rim which must be clean and dry. (See fig. 23)

V REPRODUCTION FAULTS

A. NO RESPONSE

1. Pickup cartridge dead.
2. Short in shielded lead circuit.
3. Failure of amplifier system.

B. POOR TONE QUALITY

1. Broken or worn needle. Replace with a new, approved needle.
2. Defective pickup cartridge (try a new cartridge).
3. Improper needle pressure. Adjust needle pressure to that recommended by the pick-up manufacturer and in no case less than 1-1/8 oz.
4. Vertical friction. Examine tone arm hinge (34) for binds while moving arm up and down. (See Fig.18) The shielded wire emerging from back of tone arm should be draped so as to allow free movement of the arm.

C. NEEDLE JUMPS GROOVES

1. Worn, broken or improper needle. Replace with new, approved needle.
2. Booster spring too strong. Relax booster spring (15) pressure slightly bending outward (fig. 17).
   NOTE: Booster spring does not operate after first 1/2" of record.
3. Vertical friction. Examine tone arm hinge (34) for binds while moving arm up and down. (See Fig.18) The shielded wire emerging from back of tone arm should be draped so as to allow free movement of the arm.
4. Lateral friction. Examine tone arm shaft (30) for insufficient vertical clearance and reset as required (See Fig.6) The shielded wire emerging from back of tone arm should be draped so as to allow free movement of the arm.

D. FEEDBACK or microphonism is produced if the changer is not floating freely on its four mounting springs or output volume is too high. (Hold down devices should have been loosened or removed as required.)

E. "QUAVER" OR "WOW" is usually due to quick variations in turntable speed. With the drive gear in open-tooth or playing position, remove turntable and check.

1. Rotation of spindle—examine for a bind at any point. Oil sparingly if required, after cleaning.
2. Idler wheel rubber rim should be undamaged and perfectly free from oil or grease.
3. Idler wheel mounting and slide should move freely. Spring tension on slide must be maintained. Oil slide sparingly if necessary.

F. RUMBLE *is caused by:*

1. Damaged or badly worn rubber rim on idler wheel.
2. Motor plate loose on panel, or motor loose on plate.
3. Damaged motor—rotor knocked out of alignment.

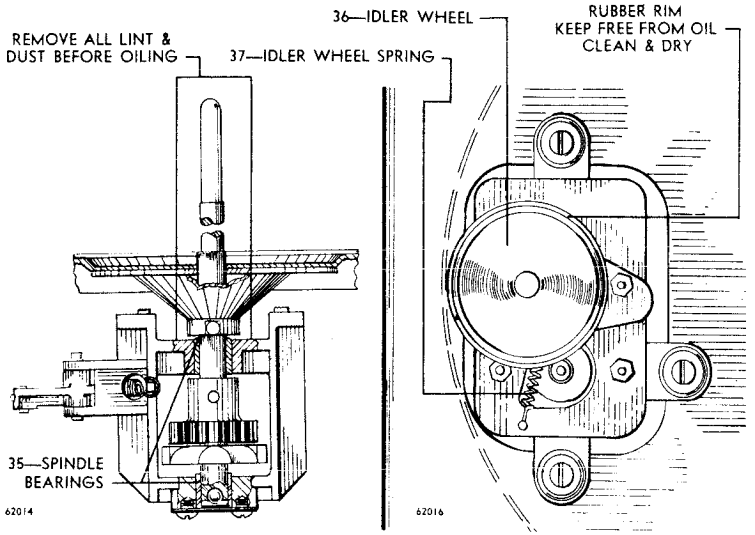

FIGURE 23.

CUTAWAY SIDE VIEW TOP VIEW—TURNTABLE REMOVED

VI LUBRICATION

A. DO NOT *lubricate*

1. Clutch engagement lever
2. Idler wheel rim and turntable rim

B. OIL, *if necessary*

1. All shafts
2. Turntable spindle

C. GREASE, *if necessary*

Cam surfaces and gear teeth

WIPE OFF all excess lubricants—over lubricatio ı is dangerous.

All part numbers shown are for a "Standard" Changer. Radio Companies which have used special pickup cartridges, tone arms, leads, or any other special parts should order them for their service stock instead of the Standard parts. Part numbers of the special items can be obtained from the Seeburg Service Dept. Motor Assemblies: Since each changer has alternate motor sources, it will be necessary to stock a quantity of service parts for each type. When ordering, be sure and give the motor assembly number stamped on the motor mounting plate.

LOAD

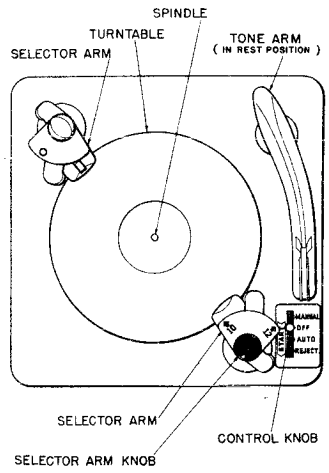
Lift and rotate Selector Knob for 10 or 12 inch records, as desired (Arrow pointing DIRECTLY at spindle). Load changer with up to fourteen 10 inch or up to ten 12 inch records. Do not intermix 10 and 12 inch records.

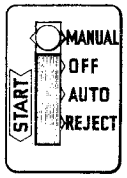
START AND STOP

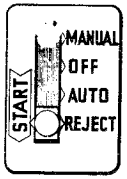
Turn radio switch "ON" and place RADIO-PHONO switch to "PHONO" setting. Move Control Knob to "REJECT" position and release it. The changer will now play the entire stack and shut off automatically. (To shut off the phonograph before entire stack has been played, move Control Knob to "OFF", lift Tone Arm and move out to Rest Position.)

UNLOAD

Control Knob at "OFF" position. Remove any remaining records on Selector Arms. Lift and turn Selector Knob until arms clear the records. Remove record stack from turntable. The changer can now be reloaded as described above.







REJECTING A RECORD

To reject a record before it has finished playing, move Control Knob to "REJECT" and release it. The changer will reject the record and then continue to play the remainder of the stack.

MANUAL OPERATION

Odd-sized or very old records and home recordings should be played in "MANUAL" position. Lift and turn Selector Knob as for unloading. Place record on turntable. Move control knob to "MANUAL" position. Place tone arm on record and when finished playing return by hand to rest position. To stop motor, move control knob to "OFF" position.

PHONOGRAPH NEEDLES

It is well to keep in mind that even though the amplifying system, speaker and tone arm are of the best quality, a faulty needle will result in poor reproduction of music.

Various types and kinds of needles are available for use in automatic phonographs. Any needle can be used that is designed to play fifteen or more selections. No attempt should be made to use ordinary steel or fibre needles, since continued use of a worn needle will damage the records being played.

There are a number of good semi-permanent types of needles on the market which are rated in number of plays. It is usually more economical to use one of these needles which is rated at 1,000 plays or more. It is also good economy from the standpoint of record wear not to exceed the maximum allowable plays on such needles.

Due to careless handling of the tone arm, needles are accidentally broken or chipped at the point. A chipped or broken needle will do far more damage to either commercial or home recordings than one which is badly worn.

The condition of the needle can sometimes be determined by the clarity of the reproduction of the higher tones. The needle should be replaced with the same type as originally supplied to insure the best tone quality and record life.

This manual presents the operational cycle of the "L" Changer. A comprehensive cross index permits reference to all parts illustrated.

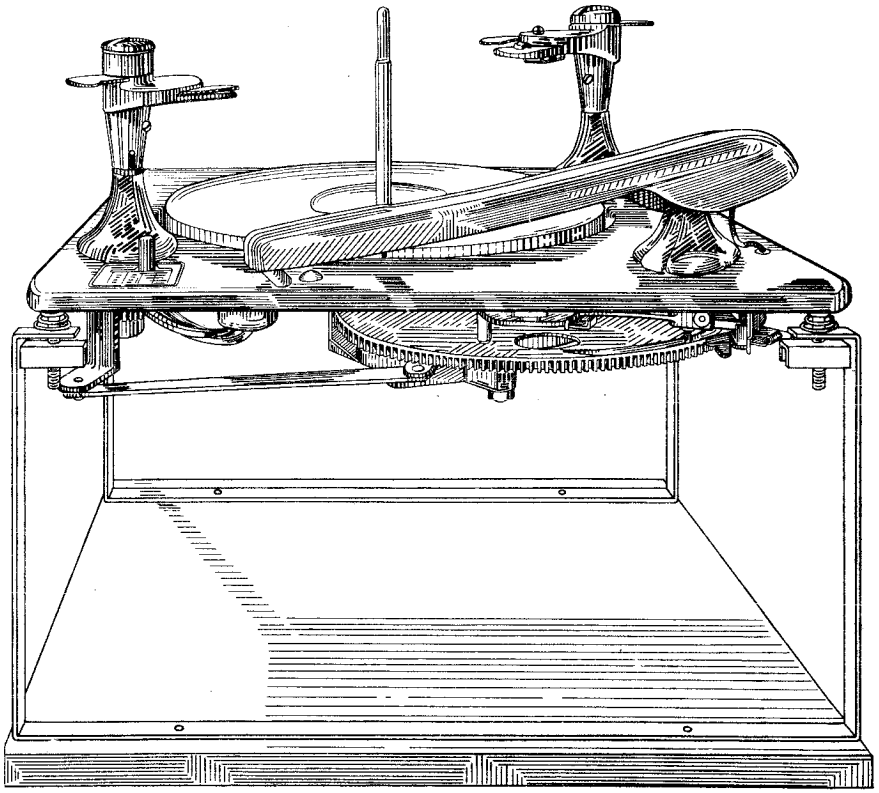


FIG. 1

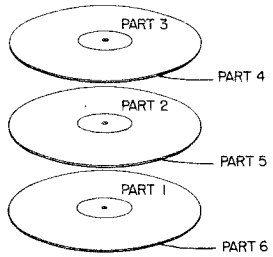
A home made work stand, indicated above, permits easy access to all parts of the changer mechanism.

©John F. Rider

RECORD SEQUENCE

Automatic Playing



Complete operatic or symphonic works usually require two or more records. When ordering such records, specify that they are for a "Drop Type" changer and arrange them in the sequence illustrated. Example:

A 3 record - 6 part rendition;

After parts 1, 2 and 3 have been played, turn the stack over and the remaining half will be in proper sequence.

CARE OF RECORDS

It takes very little care to greatly increase the life of your records. Whenever possible they should be kept in albums made for that purpose, and when these are not available, the records should be kept in their envelopes and, if possible, standing vertically on edge. Keep them in a cool dry place, out of the sun and away from stoves, radiators, etc. Excessive heat will soon warp them. Do not leave records on the selector arms for prolonged periods and remove records from the turntable when through playing.

Keep records clean by wiping them occasionally with a soft dry cloth, using a circular motion. The use of oily preparations for cleaning is not recommended as this tends to collect dust which has an abrasive action when the needle is run through the grooves.

Occasionally records become warped due to incorrect storage; particularly in warm weather or if they have been left near a radiator. Such warped records will wear rapidly and cause undesirable needle noise when being played. These records can be straightened by placing them between two pieces of plate glass and leaving them for a day or two in a warm (not hot) place. Put a weight, such as a book, on top of the upper glass.

Very dirty records are cleaned best by using soap and water at room temperature with a hand brush. Scrub gently with a circular motion and rinse thoroughly with cool tap water and wipe dry.

HELPFUL HINTS

POOR TONE QUALITY EXCESSIVE NEEDLE SCRATCH

Usually due to a damaged or worn needle or record. Replacing either, or both, is the obvious remedy.

RECORD HANGING OR CATCHING ON SELECTOR ARMS

May be caused by using defective or badly warped records. These should be played manually.

SLIPPING ON TURNTABLE

Is caused by a warped record that does not present enough contact surface to the record below it and slips, producing an uneven sound.

SQUEAKS AND CHAFING NOISES

Can be corrected by aligning unplayed records on the spindle.

DO NOT STALL

The turntable by hand while it is in motion.

LUBRICATION

A. **DO NOT** lubricate:

1. Clutch engagement lever.
2. Idler wheel rim and turntable rim.

B. **OIL**, if necessary:

1. All shafts.
2. Spindle.

C. **GREASE**, if necessary:

Cam surfaces and gear teeth.

WIPE OFF ALL excess lubricant—over lubrication is dangerous.

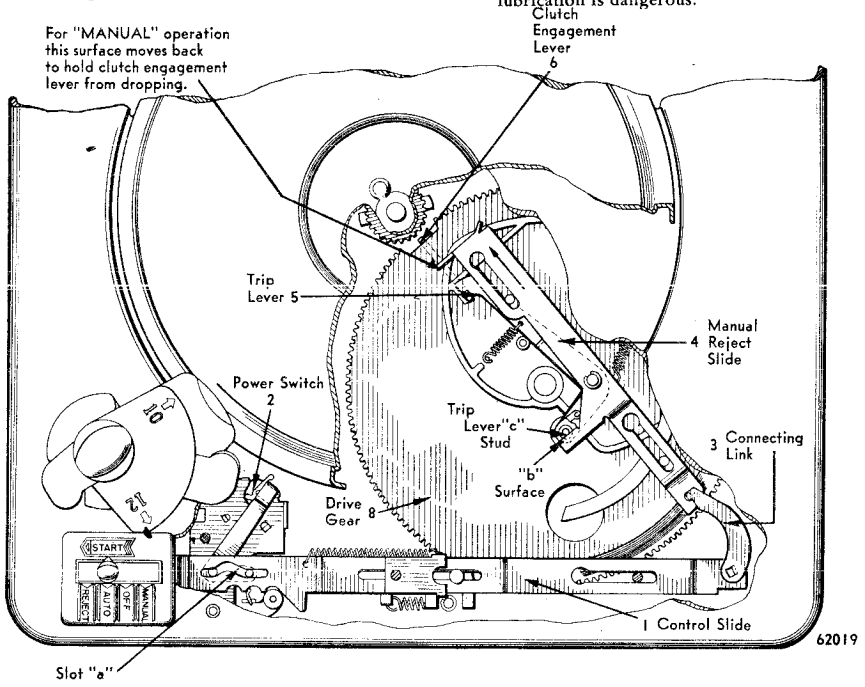


FIG. 2. CUTAWAY—TOP VIEW

1 CYCLE OF AUTOMATIC OPERATION—

After placing changer in operating position, with records on the selector arm posts, the control knob governs all subsequent automatic operations.

A. CONTROL SLIDE (1)—Moving the control slide from "OFF" to "REJECT" starts the changer into "AUTOMATIC" operation in three steps:

1. As the control slide moves from "OFF" past "AUTOMATIC", slot "a" in the control slide (1) turns on the power switch (2) starting the motor and turntable.
2. When the control knob reaches "REJECT," the changer is manually "tripped" as follows:

   The control slide pushes connecting link (3), moving the reject slide (4) in the direction of arrow. Surface "b" strikes trip lever stud "c." Trip lever (5) movement releases the clutch engagement lever. (6). Levers 5 & 6 are mounted on drive gear (8).
3. When the control knob is released, it returns from "REJECT" to "AUTOMATIC."

©John F. Rider

B. CLUTCH ENGAGEMENT—

Lug "d" on the rotating pinion gear (7) strikes extended portion of clutch engagement lever (6) causing drive gear (8) to rotate and mesh with pinion gear (7). (Open tooth or "mutilated" section of drive gear (8) permits pinion gear (7) to rotate freely, EXCEPT during the change cycle). As the drive gear (8) rotates, the muting switch blade (58) leaves the cam "g," and shorts out the pick up lead.

C. ROTATION OF DRIVE GEAR (8)—results in the following cam actions:

1. Vertical cam "e" moves the tone arm lift pin (9) and raises the tone arm.

2. Cam "j" (bottom surface of drive gear) actuates the drive link (10) that induces the quarter turn by which the selector arms release a record.
The motion is transmitted from the gear to the selector arms through the following parts: connecting rod (11), drive crank (12), selector shaft sleeve (59), pin "z," selector shaft No. 1 (60), post gear No. 1 (13), segment No. 1 (14), segment tie plate (15), segment No. 2 (16), post gear No. 2 (17). (The sleeve and pin are shown in figure 8)

All of the parts listed above operate as a unit. Whenever the selector arm No. 1 is raised this action declutches the drive portion of the mechanism from the part which provides synchronism between the two arms.

3. Surface "h" on the locked tone arm lever (11) resets the trip by latching the clutch engagement lever (6) to the trip lever (5).

4. Cam surface "g" moves the tone arm latch lever assembly (18) so as to unlatch the tone arm lever (19) at point "m." Thereafter the stud "k" on the tone arm lever follows the receding cam "f," shown in Figure 8.

5. Spring pressure from tone arm locator (20) moves the tone arm lever (19) and tone arm in toward the record. Selector arm settings determine the point at which the tone arm locator (20) stops at surface "n" on the 12" reset slide (21). Sketch above shows 10" and 12" record stops

6. The retard lever (22) contacts stud "k" and holds it in position during the time of lowering the needle on the record.

7. Tone arm lift pin (9) follows vertical cam on drive gear and lowers tone arm to the record. After the needle has touched the record, booster spring (23) exerts a slight pressure, causing the needle to enter the starting groove.

8. As the needle starts in the groove, drive gear (8) completes its rotation and is locked in open-tooth position by the drive gear stop lever (24) in detent in cam "g." Cam "g" also engages the muting switch blade (58) and restores pick up lead circuit to normal position.

D. AUTOMATIC TRIPPING—at the end of a record, the needle enters the cut-off groove and a new change cycle is set in motion by either of two actions releasing the clutch engagement lever (6).

1. **MINIMUM DIAMETER CUTOFF** occurs when trip shoe (25) strikes trip lever (5) at point "o." This should take place at approximately 1⅞" radius on the record.

2. **ECCENTRIC GROOVE CUTOFF** occurs when the tone arm is moved away from the spindle. The sawtooth edge of the trip plate (26) engages and moves the trip dog (27), causing the trip lever (5) to function. This trip operates at all positions of the tone arm, after it has played approximately half of the record.

The changer has now completed one cycle of automatic operation.

II A. AUTOMATIC SHUTOFF is of the gravity triggered type and, upon completion of its cycle, has performed the following functions: (a) Moved the tone arm into a positive locked position at the outside edge of panel. (b) Moved the control knob to the "off" position. (c) Turned off the motor switch. After the last record has dropped from the selector arm posts, the following actions occur:

1. Release of weight of record from the selector bracket button (28) permits the shutoff cam shaft (29) and the shut-off cam (30) to drop down into position for engaging the shut-off slide bracket (31) through the rivet "p." The last record having finished, the drive gear is set in motion by automatic tripping action.

2. As the drive gear (8) rotates, the stud "r" leaves contact with the shutoff bracket (32), which moves in toward the drive gear (8) by the action of the shut-off bracket spring (57). Tone arm is moved out to the rest position, and locked there by the tone arm inner latch (33).

3. The segment tie plate (15) and segment No. 2 (16) move the No. 2 post gear (17), rotating the shut-off cam (30) against the rivet "p" attached to the shut-off slide bracket (31), permitting the shut-off slide (34) to be moved by the shut-off slide spring (35).

4. The shutoff slide (34) moves against the shut-off trip (36) at surface "s." This permits the shutoff dog (37) to align itself with the shut-off bracket (32). The end of the shutoff slide (34) moves behind the tone arm center latch (38), at point "t," preventing the tone arm from unlocking when the tone arm outer latch (39), is engaged by the cam on the outer edge of the drive gear.

After the cam has passed the outer latch (39) the shut-off slide moves back to its normal position.

5. Just at the end of the drive gear cycle, the stud "r" engages the shutoff bracket (32), moves the latter to its extreme outer position, and through the locked shut off dog (37), moves the shutoff lever (40). This latter movement forces the control slide (1) into the "OFF" position and turns off the power switch (2). The completion of the drive gear cycle permits the shutoff bracket (32) to resume its rest position. As the shutoff lever (40) moves to the rest position, the shutoff dog (37), pivoted thereon, is caught by the shutoff trip (36) and reset in its rest position.

B. SHUTOFF GUARD ACTION is necessary to prevent tripping the automatic shutoff mechanism when the selector arms are manually rotated.

When the shutoff cam (3) is manually operated, through the selector arm knob, while the drive gear is in the rest position, and there are no records on the selector arms, an important action takes place. The shutoff slide (34) moves forward and contacts the shut off bracket (32) at point "y," preventing the tripping of the shutoff dog (37) by action of the shutoff trip (36). The preceding motions prevent operation of the automatic shut off mechanism.

This guard action is cleared during an automatic shutoff cycle as soon as the shutoff bracket moves in, and disengages from the stud on the drive gear. The shutoff bracket moves in, until it is stopped by contact with the stud which acts as a bearing for the trip dog. Movement of the shutoff slide is then possible because the formed down tip on the shutoff slide can move until it strikes the tapered portion instead of the flat portion at the rear of the shutoff bracket.

C. CLEARANCE POINTS:

1. SHUTOFF CAM

a. Lateral clearance—There must be no side pressure between the shutoff cam and the stud on the shutoff slide bracket for either a 10″ or 12″ setting of the selector arms, otherwise the cam will rub against the stud with enough friction so as to prevent free up and down motion of the cam due to the weight of a record.

b. Vertical clearance—There must be sufficient vertical clearance when either a 10″ or 12″ record is placed on the selector arms. The cam must be raised above the stud on the shutoff slide bracket so that there is no engagement between the two as the changer starts into a change cycle (See fig. 11)

2. SHUTOFF SLIDE—(refer to part II-A-4 for action of the shutoff slide during normal automatic shutoff cycle, and to part II-B for the guard action of the shutoff slide). There are two clearance positions that must be checked at point 2.

a. The first of these occurs when the shutoff bracket is resting against the stud on the drive gear. Under this condition the tail of the shutoff bracket must clear the formed down portion of the slide if the bracket is moved manually, but this same clearance must be sufficiently small so that the slide cannot move forward far enough to take up the clearance at points 3 or 4 (the first of which would actuate the shutoff trip and the second of which would block the movement of the tone arm center latch).

b. The second condition under which this clearance point 2 must be checked occurs when the stud on the drive gear has rotated just far enough into a change cycle so as to move out of contact with the shutoff bracket and allow the bracket to rotate into its extreme position against the stud on the panel. Under this condition there is additional clearance at point 2. This additional clearance must *now* be sufficient to:

1. Allow the shutoff slide to actuate the shutoff trip at point 3. If the clearance at point 2 is too small to allow sufficient motion of the slide the shutoff trip may fail to operate (since it will not completely clear the shutoff dog and set up the mechanism for an automatic shutoff cycle). The shutoff slide must move far enough so that the shutoff trip completely clears the shutoff dog and the dog is free to rotate against the stop.

2. Block the tone arm center latch at point 4. Excessive clearance at this point will allow the inner latch lever to be partially disengaged by the rotation of the drive gear. Insufficient clearance might cause a wedging action which would prevent smooth operation of the shutoff slide.

C-3. SHUTOFF TRIP AND SHUTOFF DOG:

Point 5 is the point of contact between the shutoff bracket and the shutoff dog. As described above in Part II-C-2-B-1, the shutoff slide actuates the shutoff trip clearing the shutoff dog, and allowing it to rotate from the position shown in figure 16a to the position in figure 16b. At point 5 and in the position shown in figure 16b, it is necessary that there be sufficient clearance between the formed up end of the shutoff bracket and end of the shutoff dog at point ("ac") so that the dog can assume the position shown in figure 16b.

It should be understood that the shutoff trip is fastened to the changer panel and is spring loaded, while the shutoff dog is attached to the shutoff lever and is also spring loaded. As the automatic shutoff cycle progresses, the drive gear stud rotates until it strikes the shutoff bracket with the cam action forcing it out

toward the edge of the panel. This outward motion of the shutoff bracket is transmitted to the shutoff lever because of the abutment shown in figure 16b at point ("ac".) (Remember that this alignment occurs only during an automatic shutoff cycle. At any other time, the shutoff dog does not engage the shutoff bracket.) Further movement of the shutoff bracket and the shutoff lever toward the outer edge of the panel will result in the shutoff dog completely clearing the shutoff trip. This position is shown in figure 16c. When this occurs the shutoff trip is free to rotate slightly so that when the shutoff bracket, shutoff lever and the shutoff dog return, the shutoff dog will engage the trip at point ("ab") and will return to the position in figure 16a. Until such a time as movement of the control slide again operates the shutoff trip, the automatic shutoff mechanism will remain inoperative since the shutoff dog is not in a position to line up with the shutoff bracket and engage it at point ("ac".) The maximum outward motion of the shutoff bracket and the shutoff lever must be sufficient so that the shutoff dog is carried far enough to completely clear the shutoff trip at point ("ab") in figure 16c.

Failure of the shutoff dog to return to the position shown in figure 16a will result in repeated automatic shutoff cycles. This condition may result from insufficient clearance at either point ("ab") or point ("ac").

4. SHUTOFF LEVER—CONTROL SLIDE:

Point 6 is the point of contact between the automatic shutoff mechanism and the control slide. It is through this contact that the control slide is moved to the "OFF" position (which also turns off the motor switch). This operation occurs when the automatic shutoff lever is moved toward the outside edge of the panel as described in the preceding paragraph.

The tip of the shutoff lever in normal position must permit free movement of the control slide into the "REJECT" position. During shutoff cycle the shutoff lever must move the control slide into "OFF." Incorrect clearance will result in:

1. Moving the control slide too far into "MANUAL" or
2. Moving slide not enough and leave it in "AUTO."

III MANUAL OPERATION—With the control knob in "MANUAL", the control slide (1) sets up four conditions:

a. The motor switch is on.

b. The end of the control slide (1) acting through the connecting link (see fig. 2) and the manual reject slide (4), partially disengages the tone arm inner latch (33) from its locked position. It now serves as a detent for the tone arm while in the rest position, and prevents its movement due to accidental bumping.

c. The manual lockout (42) on the control slide (1) prevents the tone arm locator (20) from moving inward, thereby permitting free movement of the tone arm by hand.

d. The manual reject slide (4) is pulled back so that the clutch engagement lever (6) is held, and prevented from engaging the pinion gear. (See fig. 2)

IV DETAILED DESCRIPTION OF CERTAIN FUNCTIONS AND PARTS

A. TONE ARM LATCH LEVER (also see fig. 14)

1. Functions and Positions:

a. A positive lock for the tone arm when the latter is swung to the outside of the panel, in all positions of the control slide other than "MANUAL." This is brought about by the engagement between the tone arm lever (19) and the tone arm inner latch (33).

b. A partial lock, or detent, for the tone arm while the control slide is in "MANUAL." This results when the control slide is moved to "MANUAL" position. The back end of the control slide moves the connecting link, which in turn moves the manual reject slide and the tone arm inner latch (33).

c. Complete disengagement results through the cam "g" on the outside edge of the drive gear, acting on the tone arm outer latch (39) during the AUTOMATIC change cycle. It is this unlatching action which puts the tone arm back into AUTOMATIC operation when the control slide is moved to the "REJECT" position.

IV-A-2 ACTIONS

a. When the tone arm is playing a record in AUTOMATIC position and is moved to the rest position, the tone arm inner latch (33) must positively lock the tone arm lever (19).

b. When the control slide is moved to "MANUAL," the end of the slide must work through the connecting link and the manual reject slide to move the tone arm inner latch (33), and change its contact with the tone arm lever (19) from a positive lock to a partial lock, giving a light smooth detent action when the tone arm is in rest position.

c. When the changer goes through an automatic shutoff cycle, the tone arm must remain latched in the outermost position. Normally, the tone arm would attempt to follow the cam surface of the drive gear after being unlatched, as described above.

MODEL L

J. P. SEEBURG CORP.

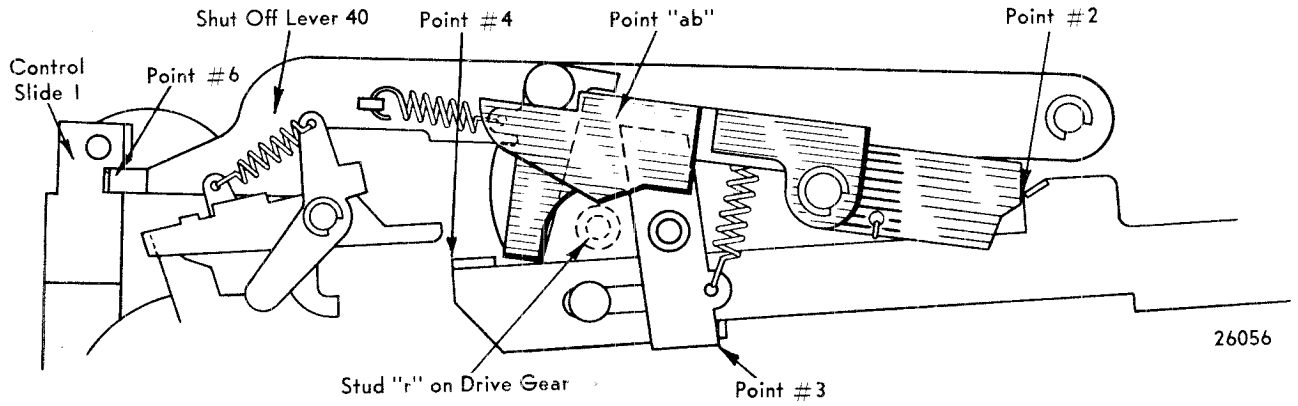

FIG. 16C. CUTAWAY—BOTTOM VIEW

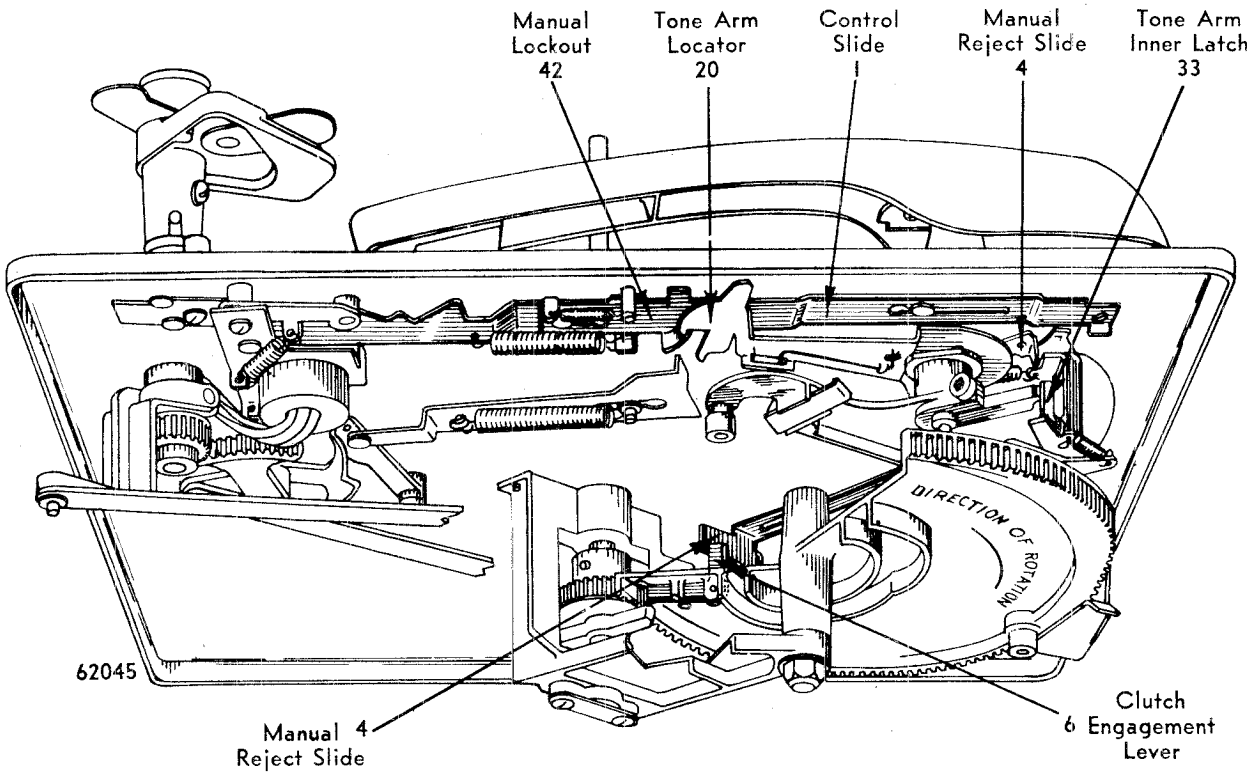

FIG. 17. CUTAWAY—BOTTOM VIEW

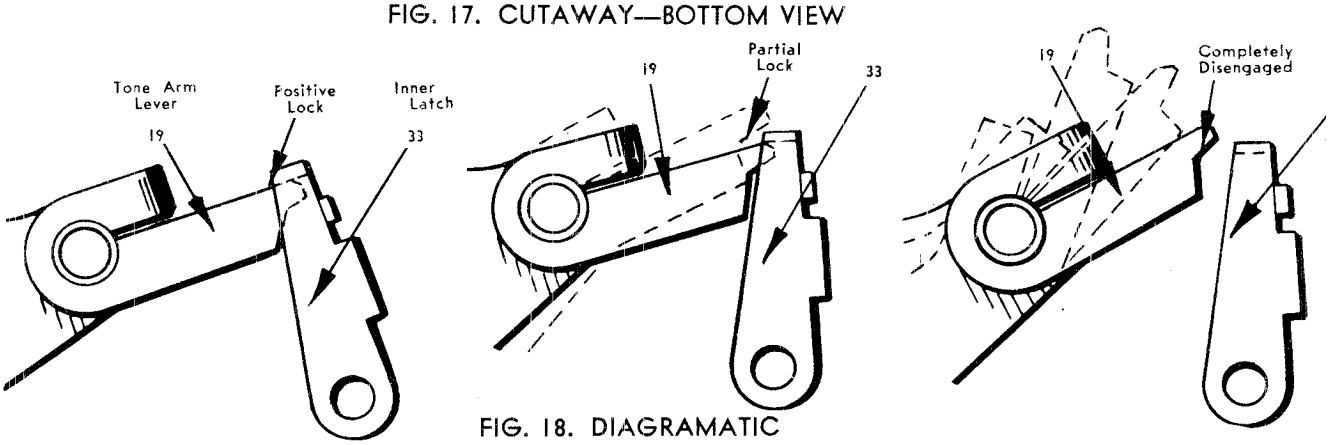

FIG. 18. DIAGRAMATIC

©John F. Rider

During the automatic shutoff cycle, it is therefore necessary to prevent this automatic disengagement by allowing the outer tone arm latch lever to move with the cam surface of the drive gear but disengaging it from the inner latch lever (and hence maintaining the positive lock on the tone arm lever).

The disengagement between the outer and inner latch levers is accomplished by holding the center latch lever in position by blocking its movement with the shutoff slide. This blocking action allows:

1. The outer latch lever to move independently, its movement being absorbed by a spring.
2. Inner latch lever to operate as a "positive" tone arm latch.
3. The center tone arm latch lever to serve as a limit device and as a connecting linkage between the outer and inner latch levers.

CAUTION: The blocking action between the shutoff slide and the center latch lever during an automatic shutoff cycle must be such that the center latch lever cannot rotate enough to disengage the positive tone arm latch. The assembly of the inner and center tone arm latch levers is held against a stop stud by means of the tone arm latch lever spring.

B. MANUAL LOCKOUT ASSEMBLY (42) engages and retains the tone arm locator (20) in its outermost position while the control slide is set in the MANUAL position. There are three actions involved:

1. When the tone arm is in the rest position, and the control slide is moved into MANUAL, the outer manual lockout (42) moves to hold the tone arm locator from moving inward.
2. The outer manual lockout (42) and the tone arm locator (20) must remain engaged while the control slide is moved into any other position, until automatically released by the drive gear cam.
3. With the tone arm lever in "MANUAL" position the manual lockout will slide back and allow the lockout engagement described if the tone arm is being moved into the rest position.

C. 12″ RESET SLIDE (21), 10″ and 12″ SET LEVER (43) and GEAR SEGMENT No. 1 (14) index the tone arm properly for a 10″ or 12″ record, depending upon the setting of the selector arms. This is accomplished by transmitting the motion of the selector knob through segment No. 1, and the 10″ and 12″ set lever to the 12″ reset slide. The engagement of the 12″ reset slide with the tone arm locator, determines the indexing of the tone arm. (See fig. 19)

CAUTION: This engagement must be such that the hook on the tone arm locator prevents manual changing of the setting. All parts above must return freely.

D. TONE ARM RETARD LEVER (22) has two functions:

1. Maintains a light pressure outwards during that part of the cycle after tone arm lever (19) leaves the cam surface on the drive gear. The purpose is to prevent overswinging of the tone arm and, hold it at the radius previously determined by the tone arm locator (20), immediately prior to and during the time of lowering the needle on to the record.

2. To prevent action of the booster spring (23) until such a time that the needle has actually landed on the margin of the record. (See fig. 28)

EXCESSIVE TENSION—on the tone arm retard lever spring (56) would tend to cause a jerky motion of the tone arm during the part of the cycle described in "1" above. Extreme tension might even cause incorrect indexing by not allowing the tone arm to go into the proper diameter as determined by the tone arm locator (20).

INSUFFICIENT TENSION on the retard lever spring would result in a premature booster spring action so that the needle would land inside the margin of the record. Extremely weak pressure, or no pressure at all, would result in an overswing of the tone arm causing the needle to land some place in the middle of the record.

E. BOOSTER SPRING (23)—Its purpose is to move the needle into the first playing groove on records which do not have a lead-in groove. Booster spring pressure is correctly adjusted when it causes the needle to move from the index point to the starting groove and no further. Excess pressure may cause the needle to scrape across the first few grooves. See "D" for tie-in with retard lever action.

F. TONE ARM KNIFE EDGE HINGE:

In order to reduce vertical friction of the tone arm to a minimum, as required for best operation with light pressure pickups, the tone arm hinge bracket (41) is of the knife edge type. A hardened steel knife edge "u" seats, under spring (50) pressure, into "v's" in the lower bracket.

1. The knife edge must not be broken or damaged.

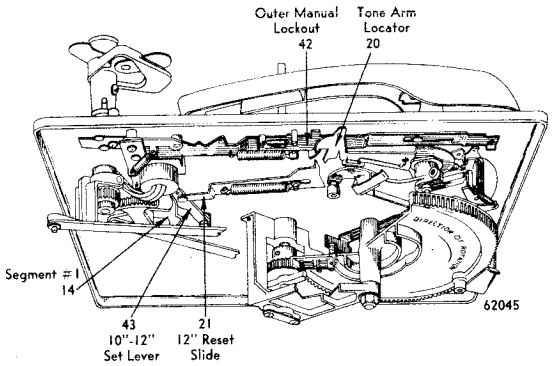

FIG. 19. CUTAWAY—BOTTOM VIEW

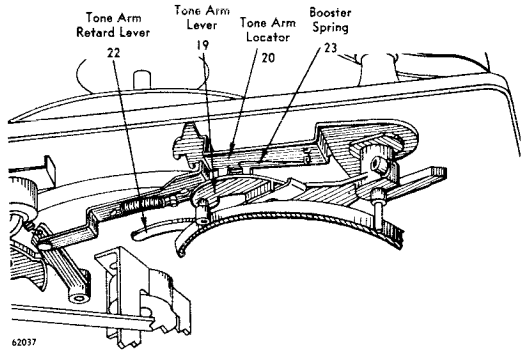

FIG. 20. CUTAWAY—BOTTOM VIEW

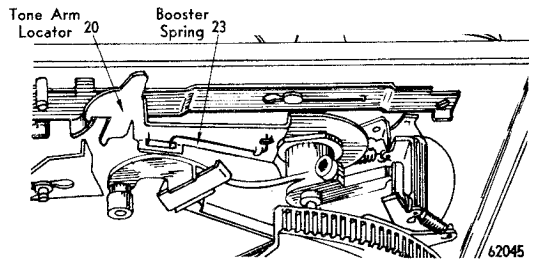

FIG. 21. CUTAWAY—BOTTOM VIEW

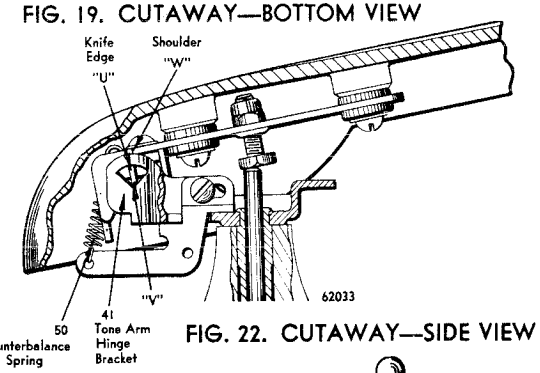

FIG. 22. CUTAWAY—SIDE VIEW

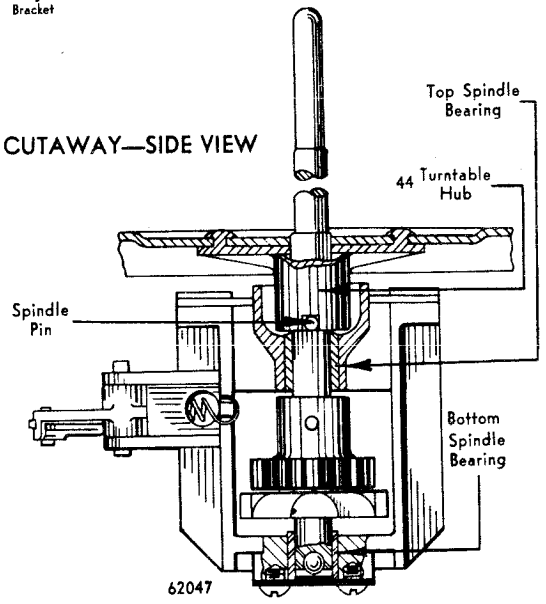

FIG. 23. CUTAWAY—SIDE VIEW

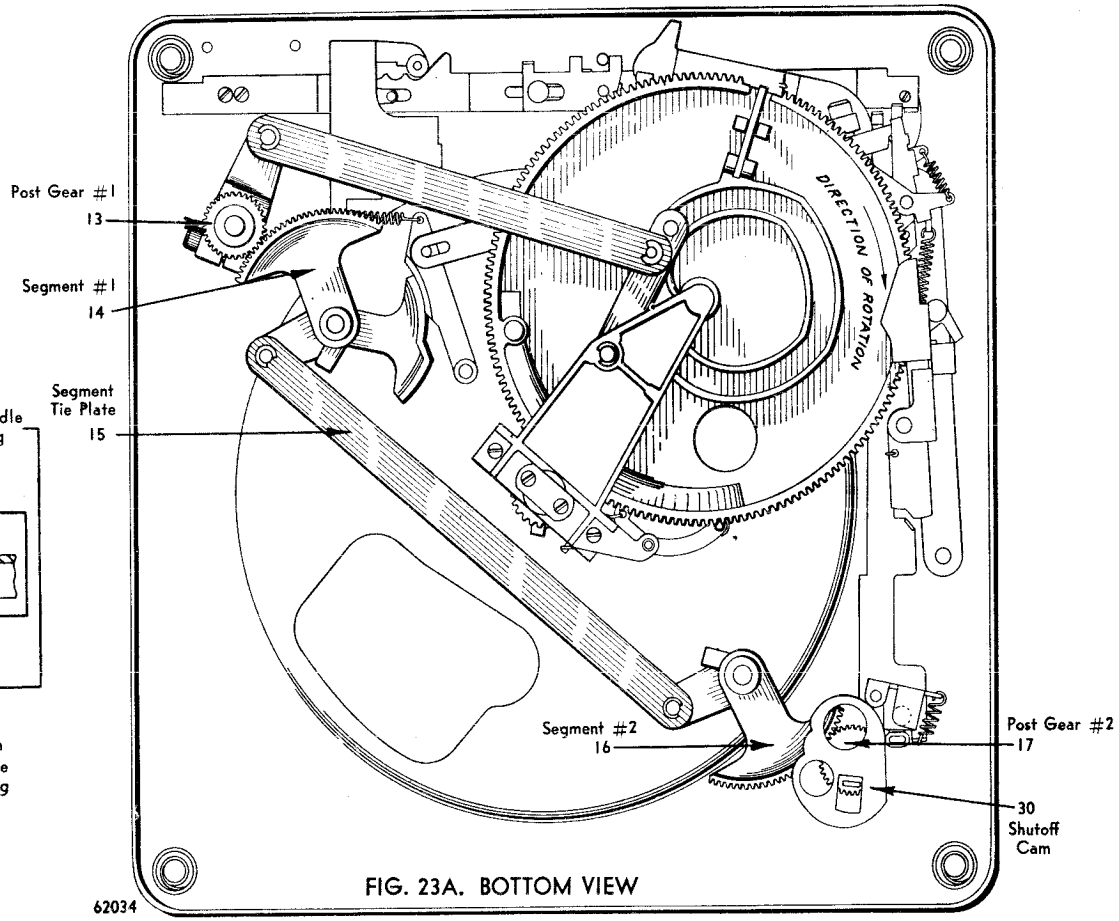

FIG. 23A. BOTTOM VIEW

©John F. Rider

©John F. Rider

2. There must be a slight amount of sidewise play between the bracket and the lower part of the knife edge shoulder, and also between the brackets themselves.

NOTE: Side clearance of the knife edge shoulder "w" in its bracket will give correct performance during playing since the knife edge is held solidly seated in the bracket by a spring. Also, the movement of the knife in the bracket, when the arm is handled manually, has no significance since the knife edge reseats itself due to the spring action when released.

3. Incorrect side play or clearance.

a. Insufficient sidewise play will result in rubbing or vertical friction.

b. Excessive clearance will result in erratic tone arm landing and cut-off operation, since the whole arm may shift slightly during the change cycle.

G. HOW TO REMOVE TURNTABLE (45)

It should be removed, by lifting carefully, tapping spindle lightly if necessary. This will expose top spindle bearing. When replacing turntable, slit in hub (44) must seat properly over spindle pin. (Rotate 180° for best fit). Push idler wheel in while lowering, so rubber rim will not be damaged by turntable edge.

V. MECHANICAL ADJUSTMENTS

A. MOTOR FAILURE, possible causes:

1. Power supply off, worn or broken wire, or defective plug.
2. Faulty switch.
3. Linkage between switch and control slide.

CAUTION:

The control slide must operate an over-center action of the switch when it is moved *slowly* in either of the positions adjacent to "OFF".

4. Burned out, or open motor coils.

B. MECHANICAL BINDS

1. During change cycle:

a. Rotate turntable by hand, clockwise.

b. If it seems to bind at one point only, examine the drive and pinion gears for foreign matter between the teeth.

c. Examine the turntable spindle and selector arm bearings for lack of lubrication.

2. During playing cycle idler wheel slide should move freely and its spring tension must be positive so that idler wheel maintains constant contact with turntable rim and motor shaft. See fig. 27.

CAUTION:

Excessive tension on this spring will cause rapid wear of idler wheel and "rumble" when playing.

C. MECHANICAL JAMS

Shut off power and proceed as follows:

1. Rotate the turntable counterclockwise slightly. This should free it.

2. Examine the mechanism for loose or bent parts or foreign matter.

3. A bent clutch engagement lever (6) would cause a failure in the meshing of drive and pinion gear teeth at the start of a change cycle.

D. RECORD JAMS are caused by:

1. Selector arms improperly set.

2. Odd-sized, badly warped or damaged records. Play these in "MANUAL" position.

3. Selector blades damaged or improperly adjusted. See G.

E. RECORDS DROP ONE SIDE ONLY if it has an unusually large center hole or a broken edge. Also examine the mechanism for a bent spindle or selector arm post, due to rough handling.

F. SELECTOR ARMS must be parallel with each other, and must be synchronized so that a record will drop evenly onto the turntable.

a. Movement of selector arms is described in paragraph 2, (fig. 5).

b. Setting of Selector Arms, Gears, and Segments.

1. Set drive gear in neutral position. Set selector arms No. 1 for 10″ records, and align the sleeve with the proper notch in the arm, tighten the cap screw on the drive crank, to the sleeve.

2. With mechanism set as described above, segment No. 1 (14) and post gear No. 1 (13) are meshed so that stop on segment No. 1 just clears the segment tie plate (15). With segment No. 2 (16) connected to the segment tie plate, the position of segment No. 2 is fixed by dimensions of the parts.

Post gear No. 2 (17) must be properly related to the automatic shutoff cam (30). When rotated in the extreme counter-clockwise position, four teeth should remain disengaged between segment No. 2 (16) and the split in post gear No. 2 (17). Or, when rotated in the extreme clockwise position, one tooth remains between the end of segment No. 2 and the split in post gear No. 2.

G. SELECTOR BLADES:

a. If an adjustment is necessary, place a 10″ record of average thickness (.074″) on the selector arms and manually rotate the turntable clockwise until the selector blade contacts the record. The blade must rise after it first contacts the edge of the record. This rising cam action, results whenever pressure is applied to the leading edge of the selector blade. The blade may be adjusted by bending, very slightly, to correct position (use pliers with tape lined jaws). The height to which blades are set must be less than the minimum record thickness, otherwise the blade will attempt to change two records at a time, due to the cam action which *always* operates in an *up direction.* When necessary, make the same adjustment on the 12″ selector blades, using a 12″ record (approx. .090″ tk.).

b. The leading edge of blade must be smoothly rounded and well polished.

c. Blade must be very free in its mounting so that it will return to normal position by its own weight.

H. INCORRECT TONE ARM INDEXING:

Examine the 12″ Reset Slide Spring (46) for being loose, of improper tension or missing.

2. Incorrect spring tension of locator spring (47).

a. Insufficient spring tension will produce erratic or incorrect tone arm landing since it will not seat in the fixed 10-12″ indexing position. It will also result in a jerky action of the tone arm, since the tone arm lever will not accurately follow the cam surface of the drive gear.

b. Excessive spring tension will result in a stiff, heavily loaded "feel" as the tone arm is moved into the rest position. It may also produce a stiff action of the control slide (when, the manual lockout is engaged) and cause increased wear on moving parts.

3. Tone arm retard lever (22) binds. Examine its pivot point for foreign matter between gear casting and shoulder screw. Also examine retard lever spring (56) for proper action. (Fig. 28

4. Excessive Clearance at tone arm hinge bracket.

I. TONE ARM POSITIONING is as follows:

NOTE: Before attempting the following procedure in order to correct tone arm landing, be sure to check section "H", since any one of those reasons may be the actual cause of incorrect landing.

1. Set the control knob in the "OFF" position (power plug out).

2. Place a 10″ record on the turntable and set the selector arms (10″ arrows pointing directly at the spindle).

3. Loosen the Allen socket cap screw (48) just enough to allow the tone arm lever to still hold its position.

4. Line up the tone arm's outer edge evenly with the panel edge. This gives the tone arm an approximate setting.

5. Push the control knob to "REJECT" and release it. Rotate the turntable clockwise and observe where the needle first touches the record. This should be about one-eighth inch from the edge. Variations should be corrected by slipping the tone arm lever (11) in correct direction.

CAUTION: Before tightening the Allen screw, make certain that there is enough vertical clearance in the tone arm shaft to avoid binding while the tone arm swings.

6. Replace the 10″ with a 12″ record and set selector arms accordingly. If the 10″ adjustment was made correctly, the 12″ indexing should be automatically correct.

J. TONE ARM HEIGHT adjustment:

1. The height to which the tone arm rises is correct when there is an approximate 1/16″ clearance between it and the bottom of a 10″ record on the selector arms. This clearance is regulated by the tone arm adjusting screw (49).

2. The down position of the tone arm is fixed by lug "x" on the tone arm hinge assembly. The correct height is that which will allow the bottom edge of the tone arm and cartridge to clear the turntable surface by approximately 1/16″. This adjustment may be corrected by a slight bending of lug "x."

K. NEEDLE PRESSURE is controlled by the counterbalance spring (50) in back of the tone arm. The pressure is variable through the counterbalance adjusting slide (51). The needle pressure should not be less than 1 1/8 oz.

L. FAILURE TO TRIP may be caused by the following:

1. Old style records without proper cut-off grooves. These should be played in "MANUAL" position.

2. Broken, worn or improper needle which does not follow cut-off groove.

3. Closed-circle trip is incorrectly set. The trip shoe (25) is moveable and loosening its holding screw allows it to be adjusted as required. This adjustment is correct when the needle is 1 7/8 inches from the record center and the trip shoe pushes the trip lever which releases the clutch engagement lever.

©John F. Rider

4. Tight tone arm lead wire. The shielded wire emerging from the back of the arm should be draped so as to permit free movement of the tone arm. Never pull it tight or tie it down.

5. The clutch engagement lever (6) not unlatching. This lever has a loose fit at its pivot point and operates by gravity. It is intended to operate dry and must never be lubricated. Keep free from dust and lint. Rotate drive gear 180° from rest position for detailed examination of lever. (See fig. 5)

6. Trip lever (5) binding at its pivot point and failing to unlatch engagement lever. Examine for foreign matter between gear casting, lever and shoulder screw. (See fig. 28)

7. Tone arm binds when moved toward spindle as a result of insufficient vertical clearance for tone arm shaft (52). This is caused by tone arm lever (19) being too close to underside of panel; loosen Allen socket cap screw (48) reset and retighten. (See fig. 26.)

M. REPEATED TRIPPING IS caused by:

1. **FAILURE OF CLUTCH ENGAGEMENT LEVER (6) TO LATCH.** With the mechanism stopped in the playing position (pinion in open tooth portion of drive gear), latch the clutch engagement lever with the aid of a pencil and unlatch by moving the control knob to "REJECT." Repeat this several times. If it fails to latch:

   a. Examine the trip lever (5) for binds or insufficient tension in the trip lever spring (53). Replacement of a weak spring will give a positive latch-up. Do not increase tension to a point where it will cause a trip failure. (See fig. 28)

   b. Control knob binding in "REJECT" position due to sticking control slide (1) or its associated levers and springs. Examine for loose or missing springs.

   c. Manual reject slide incorrectly positioned so that it fails to clear and trip lever while in "AUTOMATIC" operation.

2. **FAILURE OF STOP LEVER** to properly detent drive gear. (See fig. 9) Examine for proper spring tension.

N. TURNTABLE SPEED should be checked with a stroboscopic disc under running conditions and with the needle on a record. Slow speed may be produced by lack of lubrication in the spindle bearings or slipping of idler wheel (54). In the latter case, examine for a weak idler wheel spring (55) or for oil on the rubber rim which must be clean and dry.

VI. REPRODUCTION FAULTS:

A. NO RESPONSE due to:

1. Pickup cartridge dead.
2. Short in shielded lead circuits.
3. Failure of amplifier system.

B. POOR TONE QUALITY

1. Broken or worn needle. Replace with a new, approved needle.
2. Defective pickup cartridge (try a new cartridge).
3. Improper needle pressure. Adjust needle pressure to that recommended by the pickup manufacturer and in no case less than 1⅛ oz.
4. Vertical friction. Examine tone arm hinge for binds while moving arm up and down. The shielded wire emerging from back of the tone arm should be draped so as to allow free movement of the arm.

C. NEEDLE JUMPS GROOVES due to:

1. Worn, broken or improper needle. Replace with new, approved needle.
2. Booster spring too strong. Relax booster spring (23) pressure slightly, by bending outward. (Fig. 21)
3. Vertical friction. Examine tone arm hinge for binds while moving arm up and down. The shielded wire emerging from back of the tone arm should be draped so as to allow free movement of arm.
4. Lateral friction. Examine tone arm shaft (52) for insufficient vertical clearance and reset as required. (See par. L-7) The shielded wire emerging from back of tone arm should be draped so as to allow free movement of the arm.

D. FEEDBACK or microphonism are produced if the changer is not floating freely on its four mounting springs, or output volume is too high. (Hold down devices should have been loosened or removed as required.)

E. "QUAVER" OR "WOW" is usually due to quick variations in turntable speed. With the drive gear in open tooth or playing position, remove turntable and check:

1. Rotation of spindle—examine for bind at any point, and oil sparingly if required, after cleaning.
2. Idler wheel rubber rim should be undamaged and perfectly free from oil and grease.
3. Idler wheel mounting and slide should move freely. Spring tension on slide must be maintained. Oil slide if necessary. (See fig. 27.)

F. RUMBLE is caused by:

1. Damaged or badly worn rubber rim on idler wheel.
2. Motor plate loose on panel, or motor loose on plate.

NOTE 1. * All part numbers shown are for a standard changer. Companies ordering special parts should order them for their service stock instead of the standard parts. Part numbers of the special parts can be obtained from Seeburg Service Department.

NOTE 2. ** CONVERSION SPRINGS: a. 60 cycle motors can be converted for 50 cycle operation by the addition of a "conversion" spring. Since each changer has alternate motor sources it will be necessary to stock a quantity of conversion springs for each type motor; the motor used in any one changer can only be determined from the part number stamped on the motor mounting plate at the time the service man does the actual work.

b. Following is a list of the motor part numbers showing the corresponding conversion spring which must be used for that particular motor:

Motor	50 Cycle Conversion Spring	Idler Wheel	Idler Wheel Spring	Idler Wheel Fastener

I. Adjustment of pick-up

1. The pick-up lands too much outside or inside at the beginning of an audition:

a) Too much outside:
Turn the screw N° 1 very gently in a clockwise direction. This screw can be reached through the hole N° 2 of the unit plate when the pick-up is placed on the first groove of a 10" record.

b) Too much inside:
Turn the screw N° 1 very slightly in a counter clockwise direction.

2. The pick-up remains on the edge of a record:

This only happens when records have no running-in groove.

a) Verify that the Record Changer is mounted in a perfectly horizontal position. This can be adjusted by means of the suspension screws and nuts of the unit plate.

b) The small spring N° 3 should be slightly bent towards the interior of the aperture N° 4.

3. The pick-up lands too much inside but only for the first records:

a) Verify if the record changer is perfectly horizontal.

b) The spring N° 3 should be slightly bent towards the outside of the aperture N° 4.

4. The pick-up does not rise enough to play the last record of the pile:

Bend slightly upwards the steel wire N° 43 situated under the pick-up arm. The normal adjustment is reached when a medium needle touches the velvet of the turntable.

5. The pick-up lands and rises up immediately without playing a record:

a) Verify that the lever N° 5 turns perfectly free on its pivot, so that it is very vigorously brought into position by its spring N° 6. If this is not the case, clean the friction surfaces.

b) If this is insufficient, bend slightly upwards the arm N° 7 of lever N° 5 (hidden beneath the mounting plate) by means of a screw-driver. The arm is accessible through the hole N° 8.

6. The pick-up rises up before the end of a record:

a) This irregularity is due to the hole in the record being out of centre in relation to the grooves, or the hole is too large. Such records are not suitable for record changers.

b) If the auto-trip mechanism is considered too sensitive, bend slightly the free end of the trip lever N° 9 in a clockwise direction.

7. The pick-up does not operate immediately before being dropped on a record:

a) The tension of the flat spring N° 10 should be slightly increased so that it leans more on the cam.

b) The spiral spring N° 46 (fig. I) should be reinforced.

8. The pick-up remains on the record at the end of an a dition:

The record feeding mechanism is actioned by the auto-trip mechanism. If, at the end of an audition, the mechanism does not operate, i. e. the pick-up remains in the last groove, proceed as follows:

a) Verify if the record in question has a running-off groove. Only records with a running-off groove can be played automatically on a record changer.

b) Action the "reject" button:

1st case: The automatic cycle mechanism starts:

Remove the turntable and examine the leather of the striker N° 11. If this is worn, give it half a turn to present a new surface to the auto-trip lever N° 9 or replace it by a new one. If this leather is in good condition, then increase the tension of the friction spring by turning the adjusting screw N° 12 about half a turn in a counter-clockwise direction.

2nd case: The automatic cycle mechanism does not start:

This means that the record changer is blocked owing to the hardening of the grease on the cams, the presence of an erratic particle, or an important distortion of one of the organs. Clean the cams and gears and control the whole mechanism.

9. The 12" records rub the pick-up arm when dropping from the record spindle:

Verify the record feeding mechanism according to § II, 1 *a)* and *b)*. Adjust accordingly.

II. Record feeding mechanism

1. Records fail to drop from the record spindle:

a) Examine the thickness at the *centre* of the record. The standard thickness is between 1,5 and 2,6 mm. Thinner or thicker records do not drop correctly from the spindle. A too thin record can be played alone or on the top of the pile.

b) The correct adjustment of the push-lever N° 45 of the record spindle N° 44 is shown on fig. II. For this control, turn slowly the record changer turntable until the push-lever is out at its maximum point. If the dimension of 6,9 mm is not reached, give half a turn to the bolt N° 13 in a clockwise direction after having unscrewed nut N° 14. If the dimension of 7,1 mm is exceeded, turn in the opposite direction bolt N° 13.

2. Two records drop together from the record spindle:

In such a case, these two records are too thin at the centre or out of shape.

3. The record central hole enlarges or splits:

This only happens when the records are too thin at the centre.

©John F. Rider

III. Turntable brake, auto switch and pause

1. The record changer does not stop after the last record:

a) Verify if the lever N° 15 is free in the loop N° 16. If such is not the case, adjust this lever until it is perfectly free to move.

b) If the trouble does not come from this, verify when there are no records on the platform N° 26 if the lever N° 15 abuts against the feeler N° 17. If this is not the case, lengthen the lever N° 15 by loosening the regulating screws.

c) The irregularity may also come from an erroneous oiling of the feelers 17 and 18. Remove the oil with benzine by means of a brush.

2. The starting button does not remain on "start":

a) The lever N° 15 is engaged on the extremity of the feeler N° 17, disengage it and adjust.

b) The lever N° 18 on which is the leather of the turntable stop strikes against the edge of the hole N° 19. — Adjust.

3. The last record cannot be repeated, the record changer stops:

Bend slightly the small tongue N° 20 by means of a screw-driver in the slot N° 21.

4. The pause lasts indefinitely:

Examine firstly if the pause spring N° 22 is broken. In such a case proceed as follows:

a) Remove the motor by unscrewing nuts N° 23, place the pause button on "pause" and turn the large toothed wheels until the pause spring is quite visible. Remove the fixing screw N° 24, the broken pause spring can then be removed and replaced.

b) If the pause spring is intact, the extremity of this spring should be slightly bent towards the outside of the large toothed wheel so that this extremity meshes more effectively to the star N° 25.

c) If that is not sufficient, increase the pressure of the flat spring N° 10 against the cam.

IV. Selecting mechanism for 10" and 12" records

When the pick-up does not land into a position corresponding to the diameter of the record placed on the turntable (this record should have previously fallen from the platform N° 26 and have actioned the feelers N°s 17 and 18) proceed as follows:

a) Verify the mechanism of the record feeding following § II, 1 *a)* and *b)*.

b) If the irregularity does not arise from a faulty adjustment of the record feeding mechanism, examine if the unit plate of the apparatus has been bent by a shock in the angle of the platform N° 26. Should such be the case, carefully adjust the unit plate.

c) Verify if the lever in the form of U N° 27 does not touch the mounting board. The aperture of this mounting board should be executed following the template supplied with each apparatus.

d) Verify that the elbowed lever N° 28 is not bent or twisted, it should be perfectly free in its two articulations.

e) The lever in the form of U N° 27 should not contact the lever N° 28, but must be free to follow the motion of feeler N° 18 when a 12" record descends on the record spindle.

f) The feeler N° 18 should be perfectly free at the time when the feeding mechanism is in action. This feeler should not be oiled.

g) If all the preceding points are in order, increase the tension of the friction spring N° 29, by means of the blocking nuts N° 30.

h) The position of the abutment 10"-12" N° 31 can be adjusted by means of the two screws N° 32 if its position does not correspond to the diameter of the record descending the spindle (only modify this adjustment if all the preceding points are in order).

V. Motor

1. The speed varies during the reproduction of certain records:

a) Control these records. Records that are not flat slip over each other and thus do not correctly follow the movement of the motor.
If this difficulty does not come from the records, verify the points 2., *b)* and 3.

2. The motor does not start when the button is placed on "Start":

a) The motor can only start by itself when the pick-up is on a record or if at rest outside the turntable. When the turntable is not stopped with sufficient force, the mechanism overruns the normal rest position and the motor does not start. Change the position of the leather N° 18 to present a new surface, or renew.

b) The record spindle N° 44 should be perfectly free in the hole N° 46 of the centre shaft. Control carefully this point when in the normal playing position. This hole should be oiled from time to time.

c) Verify the lubrication of the motor following § A.

d) The stator received a shock that put it out of centre, adjust accordingly.

3. The motor stops suddenly and remains blocked:

Verify firstly if it is really the motor that is blocked and not the record changer mechanism. The stoppage of the motor is often due to the friction of the principal bearing owing to lack of oil in the hole N° 33. It may be necessary to dismantle the motor (see § B & C) to liberate the bearing.

MODEL CD-40

THORENS INC.

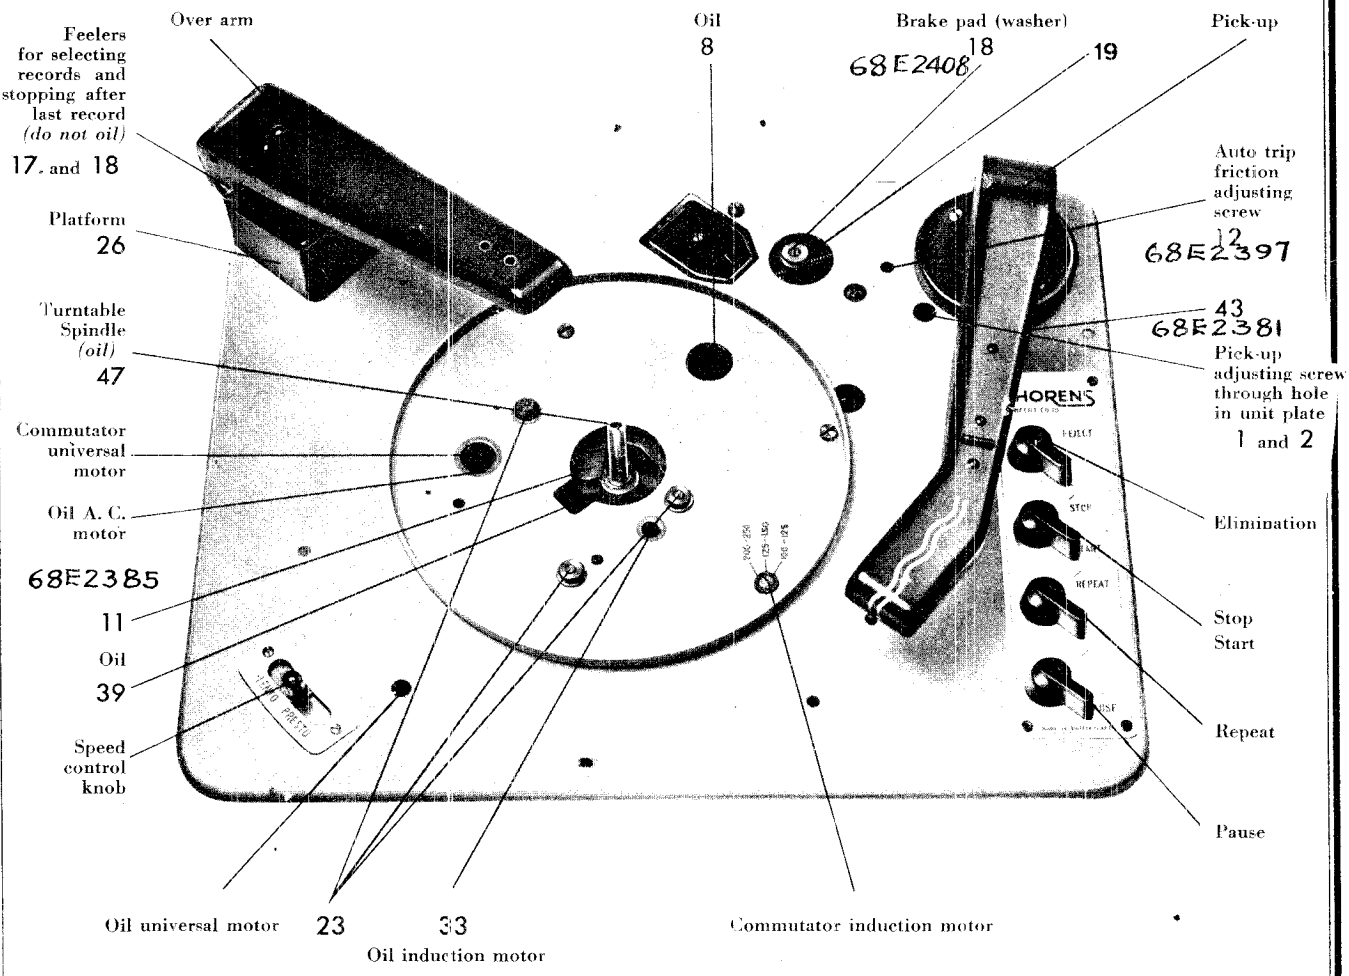

Fig. III

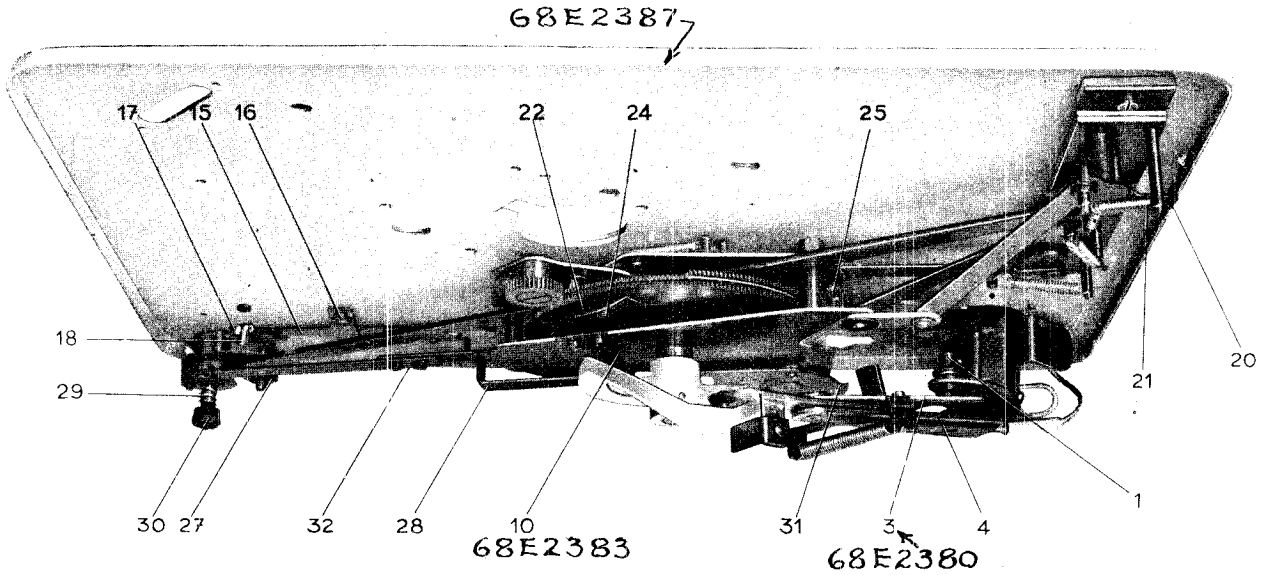

Fig. IV

©John F. Rider

MODEL CD-40

THORENS INC.

4. The motor is noisy (hissing):

a) Verify the point 2. *b)*.

b) The axial abutment ball N° 34 situated at the extremity of the rotor is worn also the steel plate N° 35 placed in the abutment N° 36 fixed to the motor casing. Dismantle the motor as shown under § B & C and replace the ball and metal plate. At the same time insert a small tube N° 37 furnished by the factory if not already supplied (see diagram N° V). The tube should be filled with vaseline or a graphite lubricant.

Remark : If the worn ball cannot be removed from the rotor with a magnet, it should be slightly ground and then removed with an awl. Do not grind the axle of the rotor.

5. The motor runs by fits and starts:

The motor should be dismantled following § B. Remove the top motor plate N° 38 by unscrewing the 3 screws. Verify if the fibre wheel is faulty (broken teeth). The centre shaft with the fibre wheel will be replaced by the factory. Lubricate before mounting the new shaft.

A. Lubrication of the motor:

The motor should be regularly lubricated generally after 100 hours use. To do this remove the turntable and introduce a few drops of good quality thin oil into the lubricating holes (coloured red), by means of an oil-can or a needle. Do not use consistent oil.

B. Dismantling of the motor from the unit plate of the record changer:

Remove the toothed wheel with the striker N° 11 by a simple pull. Loosen the 3 nuts N° 23 also the screw N° 39 of the speed regulator lever.

C. Dismantling the motor:

Unscrew the 4 fixing screws of the stator. Remove *the entire block* formed by the housing N° 41 and the stator N° 42. To reach the commutator and the abutment, *remove very carefully* the housing, leaving the block of the commutator with the stator. *Press against the commutator by the medium of the terminals to make it slide by pressure, out of the housing, which should be withdrawn at the same time.*

THORENS INC.

THORENS AUTOMATIC MIXED RECORD CHANGER
Mod. „CONCERT" CD 40

DESCRIPTION, INSTALLATION AND SERVICE INSTRUCTIONS

General description

Dimensions

The unit plate is 15 in. (380 mm.) by 12 in. (300 mm.) wide. It requires a clearance of 16 1/2 in. (420 mm.) × 14 in. (350 mm.) surface, 6 in. (150 mm.) above the unit plate, 3 1/4 in. (80 mm.) below the unit plate. Minimum height required for placing the pile of records into position before the audition : 7 1/2 in. (190 mm.) above the unit plate.

Motor

The motor is fixed rigidly to the record unit. This prevents any interference with the pick-up and eliminates all vibrations. The Record Changer "Concert" is equipped with one of the following types :

1. AC motor. The AC motor is of the induction type entirely encased. Its high pulling capacity ensures perfect functioning of the changer mechanism and its silent operation as well as its patent regulator contribute to give a faultless reproduction of your records. It causes no interference on the pick-up and the heating is reduced to a minimum.

Commutator for adaptation to the following voltages :

100 - 125
125 - 150
200 - 250
} volts AC 50 to 60 cycles.

Consumption : 15 watts maximum.

2. DC motor. The universal motor for AC and DC current presents, with a particularly high pulling capacity, the same characteristics of regularity and silence.

Commutator for adaptation to the following voltages :

Model 950 100 - 130
130 - 160
200 - 250
} volts DC and AC 50 and 60 cycles.

Special Model 912 : 6 and 12 volts DC.

Consumption : 10 watts maximum.

Caution ! The universal motor must be connected to the earth as shown on the connection plan supplied with each record changer, otherwise noise will develop.

Speed

The turntable speed is normally set at 78 r.p.m. It can be varied by means of the indicator lever.

©John F. Rider

©John F. Rider

Pick-up

The " Concert " record changer is equipped with the new highest precision Thorens pick-ups " Rondo ", " Gavotte ", " Fugue Special " or " Crystal Special types which guarantee the best audition and the minimum wear of your records.

" RONDO "	a good quality pick-up of electro-magnetic type with high impedance in arm made of stamped metal, light and rigid, which can be connected directly to radio receivers. Minimum impedance required for this connection : 50,000 ohms.
" GAVOTTE "	a high-class pick-up of electro-magnetic type with low impedance also in arm of stamped metal which must be connected to the radio receiver by the medium of its coupling transformer. Minimum impedance for this connection : 200,000 ohms.
" FUGUE SPECIAL "	a professional type pick-up, electro-dynamic with low impedance, also in arm made of stamped steel. This pick-up must be connected to the radio receiver by means of its coupling transformer. Minimum impedance for this connection : 0,5 megohms.
" CRYSTAL SPECIAL "	a high quality piezo-electric pick-up light and flexible which can be connected directly to the radio-receiver. Minimum impedance for this connection : 0,5 megohms.

These four models play with interchangeable needles.

When fixing the coupling transformer to the cabinet, see that a sufficient distance is left in relation to the motor (8 in. = 20 cm. minimum).

NOTE : Detailed technical characteristics of the above-mentioned pick-ups are described in special leaflets.

Installation

To ensure a perfect functioning of the record changer it is very important that the installation and mounting should be made in a correct manner.

A template is supplied with each apparatus. The aperture to be made in the mounting board must be executed with precision as also the drilling of the fixation holes so as to give the mechanism the necessary freedom and to obtain perfect operation. *Any effort to force or any torsion exercised on the unit plate may provoke a faulty functioning.*

The mounting on springs, following the mounting diagram, eliminates this risk and ensures a flexible and floating suspension of the unit plate. This prevents any interference with the pick-up and loud-speaker and eliminates all vibrations.

REMARK : If in the case of a very sensitive amplifier the hum level is considered too high, the apparatus should be mounted rigidly on the mounting plate. To avoid any flexion of the unit plate, it should be made rigid by means of suitable washers. If then interferences with loud-speaker do occur, this latter should be mounted on springs.

Adaptation to the tension of mains

For both types of motors the commutator permitting instantaneous adaptation to voltage of mains is placed under the turntable. After having removed the turntable, turn the commutator screw by means of a screw-driver until the slot corresponds with the desired voltage.

CAUTION. Do not proceed with any connecting or adjustment to the record changer before disconnecting mains current.

Maintenance

Motor and record changer mechanism

Motor and mechanism only need lubricating from time to time, generally after 100 to 150 hours use. To do this remove the turntable and introduce a few drops of good quality thin oil into the lubricating holes (coloured red). Do not use consistant oil which might block the motor. After a few years use it would be advisable to replace the hardened grease of the cams, gears and other rubbing surfaces by fresh and clean grease.

Do not oil the selecting feelers.

Record spindle

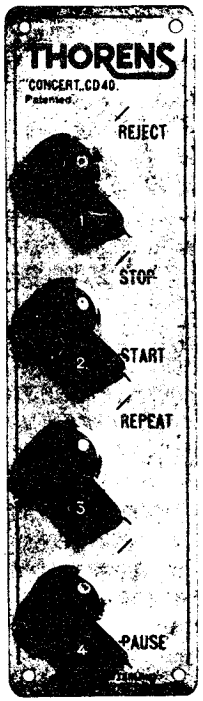
Apart from cleaning the push-lever periodically, it is necessary when oiling the motor *to introduce also a drop of oil into the hole of turntable spindle* where the record spindle pivots.

Pick-up

The pick-up being a high precision instrument, any repairs should be made through the competent services of Thorens Agencies.

Operating instructions

The " Concert " record changer CD 40 will play a maximum of ten 10 in. records or eight 10 in. and 12 in. mixed in any order. To operate, proceed in the following manner :



1. Raise overarm, place record spindle in position and place the records on the spindle shoulder. The lowest record of the pile will be played first.
2. Turn the record spindle on which the records are placed so that the lower edge of the pile of records rests on the platform. Lower the overarm, the hole in the free end then holds the top of record spindle into position in the direction of the platform. *Make sure that the overarm is completely lowered on to the record spindle.*
3. Insert needle in pick-up either a sapphire needle for record changers fitted with " GAVOTTE ", " FUGUE " and " CRYSTAL " pick-ups only, or a semi-permanent type needle that will play 10 or more records (reverse pick-up head to do this).
4. Move No. 2 knob to the position " start " From this moment, the changer functions automatically until all the records are played and at the end of last record it will stop automatically.

Any record not required to be played may be automatically *rejected* by moving knob No. 1 to position " reject ". The following record is then brought into playing position.

When the knob No. 3 is placed on position " repeat ", the record being played will be *repeated* once more as soon as the pick-up has reached the final groove.

A part only of record can be repeated if knob No. 3 being on position " repeat ", knob No. 1 is moved to position " reject ".

A *pause* of $2\frac{1}{2}$ minutes duration can be introduced between two records by placing knob No. 4 on position " Pause ".

The audition can be resumed at any moment by moving knob to its initial position.

The record changer can be stopped by moving knob No. 2 to position " stop ". It will start again if the knob is placed on position " start ", resuming playing at the place where it was interrupted.

Pause

Do not force the button into position when it resists. It can always be set going as soon as the record changing mechanism operates.

©John F. Rider

Important remarks

Placing records on record spindle

Do not place roughly the pile of records on the record spindle. This risks to deteriorate their central holes.

Pick-up changing mechanism

The movements of the pick-up are actioned by the record changer mechanism. The pick-up should therefore never on any account be forced into position by hand. The overarm should not be raised from the record spindle while playing to avoid risk of deteriorating the records.

Record spindle

It is essential that the record spindle should fit perfectly free in the hole of the turn table spindle when the overarm is in playing position. This hole should be kept quite clean.

Records

The " Concert " record changer provides for standardized records in thickness and diameter. If a thinner record or one deteriorated at the centre is employed, it may happen that it will not drop from the record spindle, and cause it to lift up. In such a case it will suffice to change the position of the record in the reserve pile in order to ensure a normal feeding.

It may happen that new records have a slight burr around the centre hole; this burr may provoke jamming of the push-lever thus hindering the release of the records. To avoid this, care should be taken to pare off the burr.

The push-lever and record spindle should be cleaned from time to time.

It is recommended to play only flat and quite clean records. The records deteriorate and wear out quickly if not kept sheltered from the dust.

Transport of record changers

Care should be taken, when forwarding, to place the apparatus in the exact position in the special packing with all the securing wedges in their correct position. The turntable shaft and record spindle should be removed from their playing position and packed separately.

Adjustment

If the record changer does not function correctly verify in the first place that the unit plate is in no manner distorted by the mounting device and that the weight is equally distributed between the four fixing screws.

Pick-up landing position

The pick-up arm has been finely adjusted so that the needle comes on to the 10 " (25 cm.) record on a 9 9/16 " (245 mm.) diameter circle, and on a 12 " (30 cm.) record on 11 9/16 " (295 mm.) diameter circle. These positions were arrived at after checking a very wide selection of records of various makes.

However, if an adjustment becomes necessary, regulate by means of the special screw near the base of the pick-up arm. The pick-up should never on any account be forced into position.

Height of pick-up

The pick-up is adjusted in such a way that a medium needle arrives at level with the turntable velvet. If another adjustment is necessary it must be executed by bending slightly the extremity of the steel wire forming the vertical abutment. The pick-up should be raised for access to this abutment.

Auto-trip mechanism

The record feeding mechanism is actioned by the auto-trip mechanism. If at the end of a record, the auto-trip does not operate, that is the pick-up remains in the last groove, examine first of all, if the record in question has a run-off groove in its centre. Only records with run-off grooves can be played on a record changer. If this is not the cause, proceed as follows:

Operate the " reject " button.

Case No. 1. The record changing mechanism starts: Take off the turntable and examine the trip lever leather. If this is worn, give it half a turn to present a new surface to the striker. If badly worn renew entirely. If the leather is in good condition, then increase the tension of the friction spring by turning the friction adjusting screw in a counter-clockwise direction, about half a turn is sufficient.

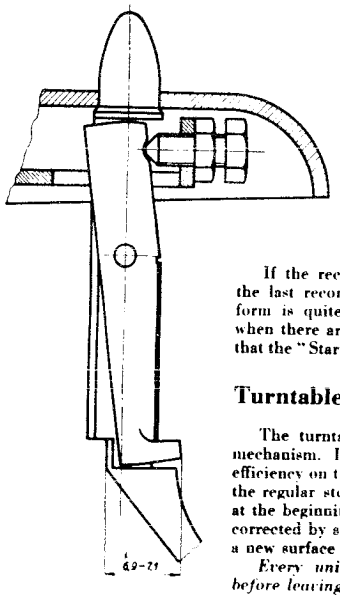
Case No. 2. The record changing mechanism remains immobile: This shows that the record changer is blocked owing to the hardening of the grease on the cams, or the presence of an erratic particle. Clean the cams and gearings and lubricate again.

Record feeding mechanism

If a record does not drop from the record spindle or drops late, examine first of all if its thickness at the *centre* is standard (1,5 to 2,6 mm.) and if the centre hole is in order and without a burr. Verify also if the record spindle is clean.

If the defect is not caused by this, remove the records, start the record changer mechanism and then stop it just at the moment when the push-lever is out at its maximum point. Then verify by means of a calibre that the course of the push-lever is in conformity to the dimensions indicated on the sketch beneath.

If the contrary is the case, adjust this course by means of the bolt situated in front of the overarm. To do this, raise the overarm, loosen the lock-nut and turn the bolt as far as necessary. Tighten up again by means of the lock-nut and verify if the course is correct.



Selecting mechanism for 10 " and 12 " records

If an error occurs when the pick-up lands on the edge of the mixed records, verify in the first place the record feeding mechanism as shown on the sketch. If the adjustment of this latter is correct, control the freedom of the smallest feeler of the platform during the feeding operation.

Last record stop

If the record changer does not stop after playing the last record, verify if the larger feeler on the platform is quite free and emerges to its proper extent when there are no records on the platform. Verify also that the " Start-Stop " button is quite free in all positions.

Turntable brake

The turntable brake is actioned by the auto-trip mechanism. If the brake does not work with sufficient efficiency on the turntable, the mechanism will overrun the regular stop position and the motor will not start at the beginning of a new pile of records. This can be corrected by slightly turning the leather pad to present a new surface to the turntable.

Every unit is thoroughly tested and lubricated before leaving the factory.

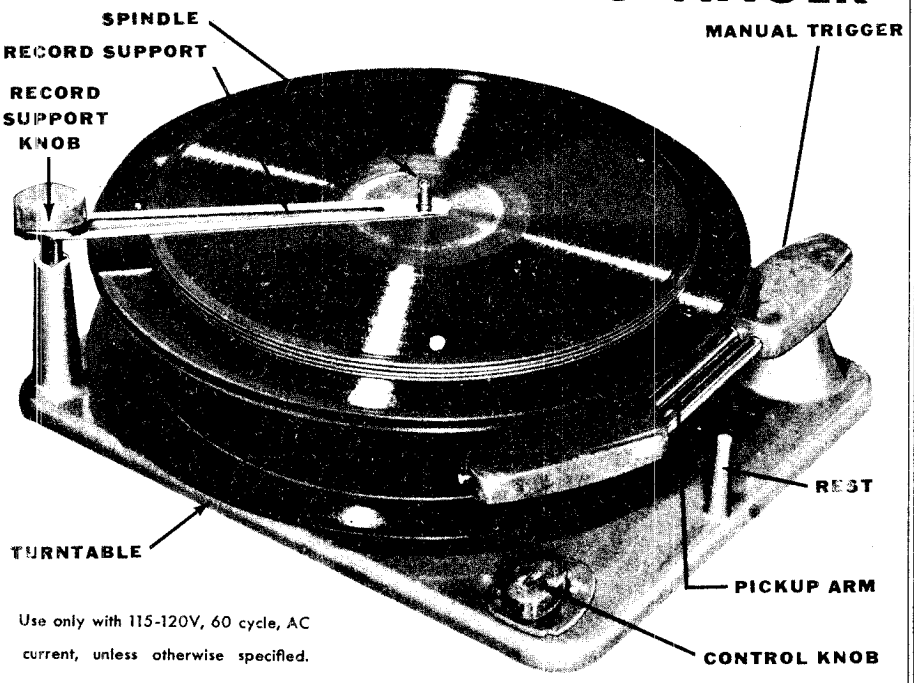
V-M CORP.

OPERATION PROCEDURE
MODEL 400 AUTOMATIC RECORD CHANGER



Use only with 115-120V, 60 cycle, AC current, unless otherwise specified.

LOADING

1. Pull straight up on RECORD SUPPORT KNOB until RECORD SUPPORT clears SPINDLE. Swing RECORD SUPPORT in either direction until pin in shaft drops into locating groove.
2. As many as ten 12 inch, twelve 10 inch or ten intermixed records may be loaded at one time. Arrange selected records in desired order.
3. Carefully place records on SPINDLE and lower to off-set shoulder. Steady records with one hand and replace RECORD SUPPORT over SPINDLE. Gently push down on RECORD SUPPORT KNOB until records are held parallel with TURNTABLE.

STARTING

To start operation of Record Changer, turn CONTROL KNOB clockwise to "REJ." and release. Changer will operate automatically until last record has been played. CONTROL KNOB then turns to "OFF" position, PICK-UP ARM returns to REST and machine automatically stops.

REJECTING

To reject a record at any time while it is playing, turn CONTROL KNOB to "REJ." and release.

UNLOADING

To remove records from TURNTABLE, lift up on RECORD SUPPORT KNOB and swing RECORD SUPPORT in either direction until pin in shaft drops in locating groove. Carefully lift entire stack of records straight up. Caution: When loading or unloading Changer use care to prevent bending SPINDLE. Records should never be left on the off-set portion of the SPINDLE as they may warp. If Changer is turned off before all records have been played, remove unplayed records from SPINDLE — or — operate "reject" until all records have dropped to TURNTABLE.

STOPPING

To turn off Changer before last record has been played, turn CONTROL KNOB to "OFF.," lift PICK-UP ARM from record and place on REST.

MANUAL OPERATION

To play single records or home recordings, pull straight up on RECORD SUPPORT KNOB until RECORD SUPPORT clears SPINDLE. Swing RECORD SUPPORT in either direction until pin in shaft drops into locating groove. Lower record to off-set shoulder of SPINDLE and tilt toward back of PICK-UP ARM. Carefully work record past off-set shoulder. Turn CONTROL KNOB to "ON" and push down on MANUAL TRIGGER located near back of PICK-UP ARM. Machine will then operate independently of cycling mechanism *provided* — PICK-UP ARM is moved all the way into the SPINDLE *before* it is returned to REST after record is played. When playing "inside-out" records, move PICK-UP ARM all the way into SPINDLE before setting it down on first playing grooves of record.

REPEATING

To repeat a record, any records remaining above off-set shoulder of SPINDLE must be removed. Pull straight up on RECORD SUPPORT KNOB until RECORD SUPPORT clears SPINDLE. Swing RECORD SUPPORT in either direction until pin in shaft drops into locating groove. Carefully lift records from SPINDLE. *Do not replace RECORD SUPPORT over SPINDLE.* Changer will repeat top record on TURNTABLE until CONTROL KNOB is turned to "OFF."

SUGGESTIONS

For best results use a good standard semi-permanent type needle.

Poor reproduction may be caused by a poor or damaged needle or worn, warped, dished or dirty records.

Records should be stored away from heat, in a record album or laid flat. Clean records periodically with a soft, lint-free cloth.

Avoid dropping PICK-UP ARM on record. Needle or record or both may be damaged.

Mechanism will operate automatically on all *standard* records. In case of records not having the standard "trip groove," (a spiral groove near center of record), when PICK-UP ARM reaches end of record, turn CONTROL KNOB to "REJ." to bring next record into playing position.

FIG. 1 - MODEL 50 RECORD CHANGER

I MODEL 50 RECORD CHANGER

The Webster Model 50 is a single post, Spring cushioned Spindle, Automatic Record Changer. Simple in design and operation, it provides manual or automatic playing of standard ten or twelve inch records with a minimum of waiting time between records during automatic operation. Home recording or "Inside Out" records up to the 12 inch size may be played manually. This machine will change warped or rough-edge records, at the same time assuring maximum protection to the finest discs. When set for automatic operation, Model 50 will continue to repeat a single record placed on the turntable (or the last record of a stack) until the control knob is returned to the "STOP" position.

II OPERATION

A - MOTOR

Connect the motor cord to a source of 105-125 volt 60 cycle current only. For 105-125 volt 50 cycle operation, a special motor pulley (Part 17X412-4) must be used in place of the one supplied with the changer in order to drive the turntable at the required speed of 78 R.P.M.

Do not under any circumstances connect the motor to a source of direct current or alternating current of any other frequencies.

B - PICKUP

The pickup cartridge supplied with this unit is of the high impedance crystal type. This means that it may be connected to the average amplifier, radio set or public address system without using coupling transformers or impedance matching devices. Generally speaking, it is customary to connect the crystal from grid to ground of the first audio tube so that at least two stages of amplification are available. Most modern radio receivers have the volume control in the audio circuit and in such cases, the pickup may be connected directly across the volume control. In radio

©John F. Rider

II OPERATION (Cont'd)

B - PICKUP - Cont'd.

receivers having other than the audio type control, an auxiliary control will be required to adjust the record volume.

The crystal supplied with this unit may be of the fixed permanent point or the removable needle type. If it is the latter, use a needle which is 11/16 inches long for most satisfactory results.

The choice of a needle is largely a matter of personal preference since all needles have their good features.

There are many types of permanent point needles available for use with automatic record players. These may be straight shank, offset, solid or hollow shank, floating point, sapphire or hard metal point types.

Some desirable qualities of a good needle are faithful reproduction, low surface scratch or hiss, long wearing qualities, minimum record wear and rugged construction.

Do not use single play or cactus needles for Automatic Operation.

C - OPERATION - Automatic

1.- Turn the Record Selector Post to TEN or TWELVE for ten or twelve inch records.

2 - With the Record Ballast Weight turned back, place up to ten 12" records or twelve 10" records on the Spindle so that the bottom record rests on the step of the Spindle and on the shelf of the Record Selector Post

3 - Turn the Record Ballast Weight forward to rest on the top record.

4 - Move the Control Knob from the STOP position (nearest the pickup arm rest) to the START-REJECT position (farthest from the pick-up arm rest) and release. The control will then drop back into the automatic playing position and the mechanism will continue to operate automatically until the control is returned to the STOP position.

5 - To reject any record while playing in the automatic position, move the control knob momentarily to the START-REJECT position and release.

NOTE: The mechanism may be turned off at any time or during any portion of the change cycle by moving the Control Knob to the STOP position. The pickup arm may be moved horizontally at any time without damage to the mechanism. However, the pickup arm cannot be returned to the pickup arm rest until the change cycle has been completed.

6 - After the last record has been played, the entire stack may be removed from the turntable at one time. The simplest procedure is as follows:

a - Place the Pickup Arm on the Pickup Arm Rest.

b - Turn the Record Ballast Weight back out of position.

c - Place the fingers of both hands under opposite edges of the bottom record.

d - Do not apply pressure to the top record. (Keep your thumbs free.)

e - Lift the stack of records straight up following the contours of the spindle. This permits the stack of records to follow the curve of the spindle without binding and greatly facilitates the removal of the stack.

D - OPERATION - Manual

1 - Turn the Record Selector Post to the TWELVE inch position (this is not essential but permits more clearance in loading and unloading records).

2 - Place a record on the turntable. It may facilitate this operation if the record is placed over the spindle at an angle, with one edge of the record held below the level of the record selector post shelf. Records may be removed in the same manner.

3 - Move the Control Knob from the STOP position to the MANUAL position (toward the spindle). No harm will result if the knob is accidently moved to the START-REJECT position while moving it from STOP to MANUAL. If a twelve inch record is on the turntable, the arm will automatically index to the edge of the record. If a ten inch record is on the turntable, the needle will be set down gently on the rubber pad and the arm may then be moved manually to the edge of the record.

4 - Place the needle gently on the edge of the record.

Particular care should be exercised if your pickup has a sapphire point needle. Although the sapphire is very hard and long wearing, it is extremely brittle and may be fractured or chipped if dropped on the record.

5 - To stop the mechanism at any time, move the Control Knob to the STOP position.

III SERVICE INFORMATION

This unit has been accurately adjusted, lubricated and tested at the factory and should require no further adjusting in the field. If service repairs become necessary, this bulletin should be studied carefully before making any adjustments or replacing parts.

Service parts are available at the factory. All parts must be ordered by Part Number, Model Number and Production Number stamped on the under side of the main plate.

©John F. Rider

IV SERVICE REPAIRS

Service repairs and adjustment on the Model 50, listed by the apparent condition are as follows:

A - AUTOMATIC TRIP FAILS TO FUNCTION

When the movement of the pickup arm toward the spindle is greater then 1/8 inch in 1/2 revolution of the turntable, the Automatic Trip Arm trips the Velocity Trip and Roller Assembly. This releases the Actuating Pawl on the Main Cam Assembly, allowing it to engage the Main Cam Actuating Gear and driving the mechanism through the change cycle.

The automatic trip arm follows the movement of the pickup arm through a spring compression clutch. This clutch must be kept free of oil or grease.

Should it become necessary to clean the clutch, loosen the lock (Point "A" Figure 8) to relieve the spring tension and clean the clutch parts with carbon tetrachloride. Reset the clutch spring tension by setting the lock at least 1/4 inch below the main plate. This tension should be just sufficient to operate the trip mechanism without placing undue drag on the movement of the pickup arm.

Also check for:

1 - Velocity Trip and Roller assembly binding (Illus.44 Fig. 7)

2 - Actuating pawl stuck (Part of Main Cam assembly, Illus. 42 Fig.7, engaged by hook end of Velocity Trip and Roller Assembly.)

3 - Automatic Trip Arm (Illus. 26 Fig. 6) bent and not hitting the Velocity Trip and Roller Assembly.

4 - No velocity lead-in groove or eccentric groove in center of record.

5 - Foreign matter in record groove.

6 - Badly worn record.

7 - Badly worn or bent needle.

B - MANUAL TRIP FAILS TO FUNCTION

The manual trip is operated by the control knob. When the control knob is moved to the start-reject position, the Manual Trip Lever is actuated, tripping the Velocity Trip and Roller Assembly and putting the mechanism in cycle.

Check for:

1 - Manual Trip Lever (Illus. 29 Fig. 6) hair spring bent or broken.

2 - Velocity Trip and Roller Assembly binding (Illus. 44 Fig. 7.)

3 - Actuating pawl stuck.

C - NEEDLE SKIPS GROOVE

With the pickup arm in playing position, the arm is practically free-floating on its pivot. There is no lead-in spring which might drag the needle over the first few grooves of the record or minimum radius device to jam the arm on the inside grooves.

The pressure required to actuate the trip mechanism is negligible.

Should the needle skip grooves at any time, check for:

1 - Record Changer not level.

2 - Pickup Arm binding.

3 - Foreign matter in record groove.

4 - Badly worn record groove.

5 - Badly worn or bent needle.

6 - Pickup cord caught in hinge.

D - MECHANISM CONTINUES TO CYCLE

At the completion of the change cycle the actuating pawl is engaged by the hook end of the Velocity trip and Roller Assembly which has been returned to its normal position by the reset points on the main cam drive gear. This hook should be adjusted for about .005 - .015 clearance from the bottom of the main cam drive gear. Greater clearance may permit the pawl to bounce past the hook and re-engage. Also check for:

1 - Velocity Trip and Roller Assembly (Illus. 44 Fig. 7.) rubbing on Main Cam Actuating gear (Illus. 42 Fig. 7.)

2 - Manual Trip Lever (Illus. 29 Fig. 6.) binding.

3 - Disengage roller broken on Velocity Trip and Roller Assembly.

E - PICKUP ARM LIFT TOO HIGH OR TOO LOW

1 - The Needle should approach the top record of a full stack on the turntable with approximately 1/8 inch clearance. Adjust by bending the Pickup arm Raising Lever at Point C., Fig. 8. Do not attempt to move Pickup Arm Raising Disc up or down.

F - NEEDLE LET DOWN INDEXING INCORRECT

The eccentric screw, accessible through the top of the pickup arm, should take care of any normal adjustment. Turn this screw clockwise to index the needle in toward the spindle and counter-clockwise to index the needle out away from the spindle.

Should further adjustment be necessary, proceed as follows:

1 - Set the Record Selector Post to the TEN inch position.

2 - Operate the mechanism by revolving the turntable manually until the needle drops to within 1/8 inch of a ten inch record on the turntable.

3 - With a #8 Bristol wrench in each of the set screws (Points D and E, Fig. 8) alternately loosen one and tighten the other until the needle rests

©John F. Rider

IV SERVICE REPAIRS (Cont'd)

F - NEEDLE LET DOWN INDEXING INCORRECT Cont'd.

above the record lead-in groove at the desired point.

4 - Turn the Record Selector Post to TWELVE and check the needle drop on a twelve inch record.

5 - Be sure that both set screws are tight when this adjustment is completed.

G - PICKUP ARMS DROPS OFF REST

When the Pickup Arm is moved to the Rest position, the lip of the Pickup Arm Raising Disc rests in the groove formed by the inside bevel of the lower Pickup Arm Pivot Shaft Bracket touching the Stud post. (Fig. 8) On units prior to Production No.375613 this function was performed by a chamfered and grooved collar on the stud post.

Adjust the position of the bracket (or collar) so that the lip of the Pickup Arm Raising Disc rests in the groove with the Pickup Arm Pivot Shaft touching the sub plate. When properly adjusted, there should be .010 clearance between the lip of the Pickup Arm Raising Disc and the bottom of the groove. The position of the Pickup Arm on the Pickup Arm Rest is adjusted by bending the lip of the Pickup Arm Raising Disc, so that when the Pickup Arm is resting on the Pickup Arm Rest Assembly, the lip of the Pickup Arm Disc rests in the groove formed by the bracket and stud. After making this adjustment, check the setdown of the needle on a 12" record to be certain that the lip of the Pickup Arm Raising Disc does not hit the beveled side of the bracket.

H - RECORD SELECTOR POST ANGLE INCORRECT

The Record Selector Post should be so adjusted that the curve of the shelf matches the curve of the record. To adjust this angle:

1 - Turn the Record Selector Post to the TEN inch position.

2 - Place a ten inch record on the spindle in the normal position for automatic playing.

3 - With a #8 Bristol wrench in each of the set screws (Point H and J, Fig. 8) alternately loosen one and tighten the other until the Record Selector post angle is correct. Be sure that both set screws are tight at the completion of this adjustment.

I - SPINDLE DROPS MORE THAN ONE RECORD

The floating latch at the top of the spindle is so spaced that only one record at a time can slide between the heel of the latch and the step of the spindle. The hole in the latch is elongated so that the latch can slip into the spindle recess when records are being removed.

If more than one record is dropped at a time, it will be found to be due to

1 - Foreign matter in spindle recess causing the latch to stick.

2 - Exceptionally thin records. Standard records are 0.070 to 0.100 in thickness.

J - RECORD DROPS ON PICKUP ARM

As the change cycle is started by the needle riding in the center lead-in groove of the record, the first motion of the cam causes the Record Selector Post to move toward the spindle about 3/32 inches. This position is maintained until the Pickup Arm has made its full lateral excursion at which time the Record Selector Post again moves toward the spindle, causing the bottom record to drop into playing position.

If the Record Selector Post has been bent back, away from the spindle, it is possible for a standard record to rest on the spindle step with its edge just over the edge of the Record Selector Post shelf. Then as the change cycle is started, the record is pushed off the spindle by the initial movement of the Record Selector Post, so that it drops on the Pickup Arm.

To correct this condition, The Rocker Arm Assembly must be bent so that the Record Selector Post is brought nearer to the spindle.

1 - With the mechanism at rest, wedge the Rocker Arm firmly by inserting a screwdriver between the Rocker Arm and the Sub Plate at a point between the Rocker Arm Pivot (Illus. 36 Fig. 5) and the stud.

2 - With the heel of the hand, press the Record Selector Post toward the spindle, so that a standard record rests at least half way over the Record Selector Post ledge when placed on the spindle step.

It is recommended that the distance between the edge of the record and the step of the Record Selector Post be held to 1/32 of an inch so that records with rough or sharply beveled edges will not catch on the outer edge of the Record Selector Post.

CAUTION: Be certain that a standard size record is used in making this adjustment. A standard 10" record measures 9-7/8" ± 1/32" dia. A standard 12" record measures 11-7/8" ± 1/32" dia.

V LUBRICATION

Model 50 Record Changer leaves the factory completely oiled and lubricated. Under normal conditions this should be sufficient for approximately one year or 1,000 hours of operation. When operated under extreme conditions of dust or heat, this operation should be performed more frequently as required.

NOTE: AVOID EXCESSIVE LUBRICATION

Do not permit any oil or grease to get on the rubber idler drive wheel or the Motor Sleeve (Illus. 11 and 21, Fig. 4), on turntable drive rim or on the automatic trip arm clutch. Any oil or grease on these points should be removed using Carbon Tetrachloride.

WEBSTER CHICAGO CORP.

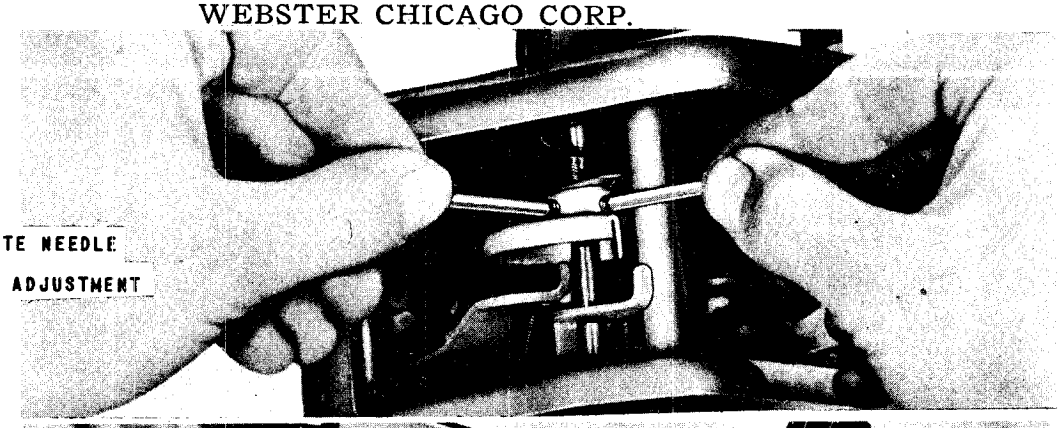

FIG. 2 - ALTERNATE NEEDLE LET DOWN INDEXING ADJUSTMENT

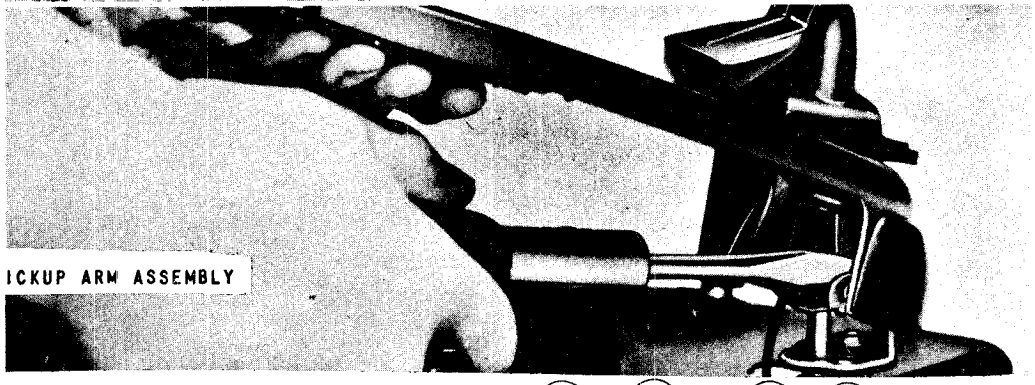

FIG. 3 - REMOVING PICKUP ARM ASSEMBLY

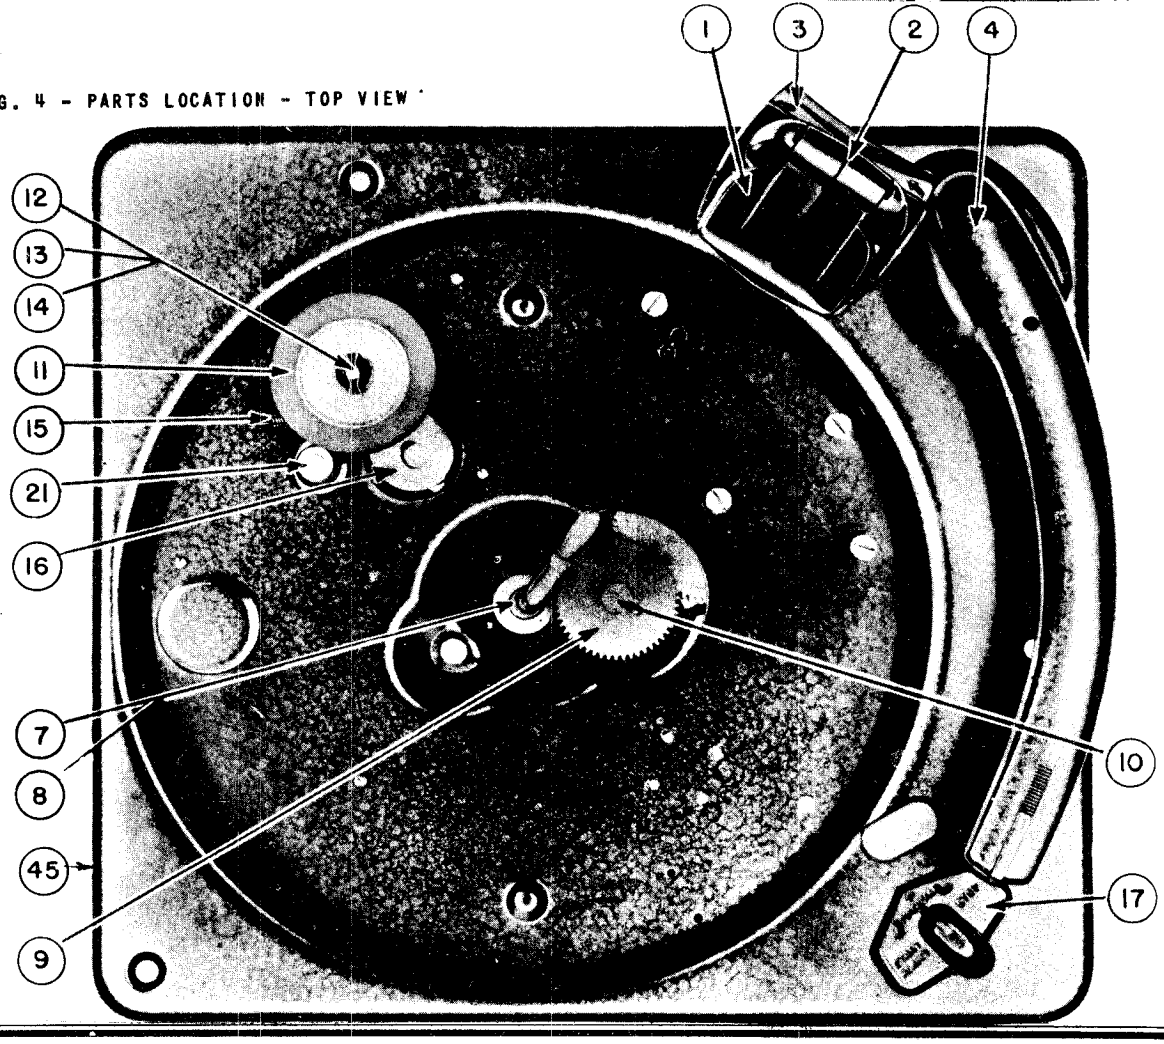
FIG. 4 - PARTS LOCATION - TOP VIEW



©John F. Rider

©John F. Rider

V LUBRICATION (Cont'd)

The recommended lubricants and points of lubrication are as follows:

A - #10 oil (apply with small oil can or medicine dropper)

1 - Motor Bearings. Saturate top and bottom felts.

2 - Pickup Arm Shaft (Illus. 22 Fig. 6). Apply one drop each to bottom bearing point, bracket hole and hole through Main Base Plate.

3 - Ball Bearing Assembly (Illus. 7 Fig. 4).

4 - Idler Wheel Felt (Illus. 13 Fig. 4)

B - LUBRIPLATE (APPLY WITH SMALL BRUSH)

1 - Idler Wheel Link (Illus. 16 Fig. 4).

2 - Turntable Shaft Stud.

3 - Pickup Arm Hinge Pins.

4 - Knife edge of Raising Lever (Illus. 33 Fig. 7).

5 - Main Cam bearing. (It is necessary to remove the sub-plate assembly to lubriplate this bearing. See paragraph VI-C)

C - STA-PUT (APPLY WITH SMALL BRUSH)

1 - Teeth of Main Cam Actuating Gear (Illus. 43 Fig 7).

2 - Track of Main Cam Gear (Illus. 42. Fig. 7)

3 - Teeth of Large and Small idler Gears (Illus. 9 Fig. 4).

4 - Raising Lever Bracket bearing surfaces (Illus. 33 Fig. 7).

5 - Selector Lever Stop (Illus. 40 Fig. 5).

VI MECHANICAL REPAIRS

A - TO REPLACE A PICKUP CARTRIDGE

A Pickup cartridge can be most easily replaced by first removing the Pickup Arm.

1 - Hold the Pickup Arm firmly with left hand.

2 - Using a tool such as a screw-driver, press in on one of the blue steel Pickup Arm hinge brackets while lifting up on the arm. (Fig. 3). This will release the Pickup Arm Hinge pin.

On the models later than Production No. 375613 a spring is inserted between the pins of the Hinge Bracket. This spring must be removed before the hinge can be taken apart.

3 - Repeat on the other pickup arm bracket.

4 - The Pickup Arm, when released from the hinge brackets, may then be turned over and laid on the turntable for easy access to the cartridge.

B - TO REPLACE THE PICKUP ARM

The Pickup Arm may be replaced on its bracket as follows:

1 - Line up the guide slots in the Shaft Bracket, with the pins in the Pickup Arm Bracket.

2 - Hook the roller (on the rear of the hinge assembly) under the Pickup Arm Lift Stop Bracket keeping the guide slots and pins in line.

In performing this operation, be sure that the pickup cord lies outside of the hinge and does not become wedged in the bracket.

3 - Press down firmly on the Pick-up Arm base until the hinge pins fall into the bracket holes.

On models after Production No. 375613, the hinge should be re-assembled, using a pair of long-nosed pliers to place the Pickup Arm Hinge Bracket over the pins in the Shaft Bracket. The retaining spring need not be replaced unless the unit is to be reshipped.

C - TO REMOVE THE SUB-PLATE ASSEMBLY

In the event that it becomes necessary to replace any of the major parts in the sub-plate assembly (Fig. 7) the entire assembly should first be removed from the main plate.

1 - Remove the spindle which is held in by a cotter pin under the sub-plate.

2 - Remove the Turntable.

3 - Remove the Pickup Arm.

4 - Unhook the Rocker Arm Return Spring.

5 - Remove the Rocker Arm Pivot Pin.

6 - Remove the five #8 - 32x1/4 screws holding the sub-plate studs and the #8-32x3/8 screw holding the center post to the main plate.

D - TO REPLACE THE SUB-PLATE ASSEMBLY

Reverse the above procedure making certain that all parts fall into their proper positions. Particularly note The Selector Lever and Selector Lever Compression Spring to see that they are in position with the lever through the slot in the Pickup Arm Raising Lever Bracket.

WEBSTER CHICAGO CORP.

E - TO REMOVE THE RECORD POST AND ROCKER ARM ASSEMBLY

1 - Unhook the Rocker Arm Return Spring. (Illus. 37 Fig. 5).

2 - Remove the Rocker Arm Pivot Pivot Pin. (Illus 36 Fig. 5).

3 - Unfasten the Trim Plate

4 - Lift out the Selector Post, Rocker Arm and Trim Plate as a unit.

5 - In replacing the Rocker Arm assembly, note Paragraph VI, D "To Replace Sub-Plate Assembly."

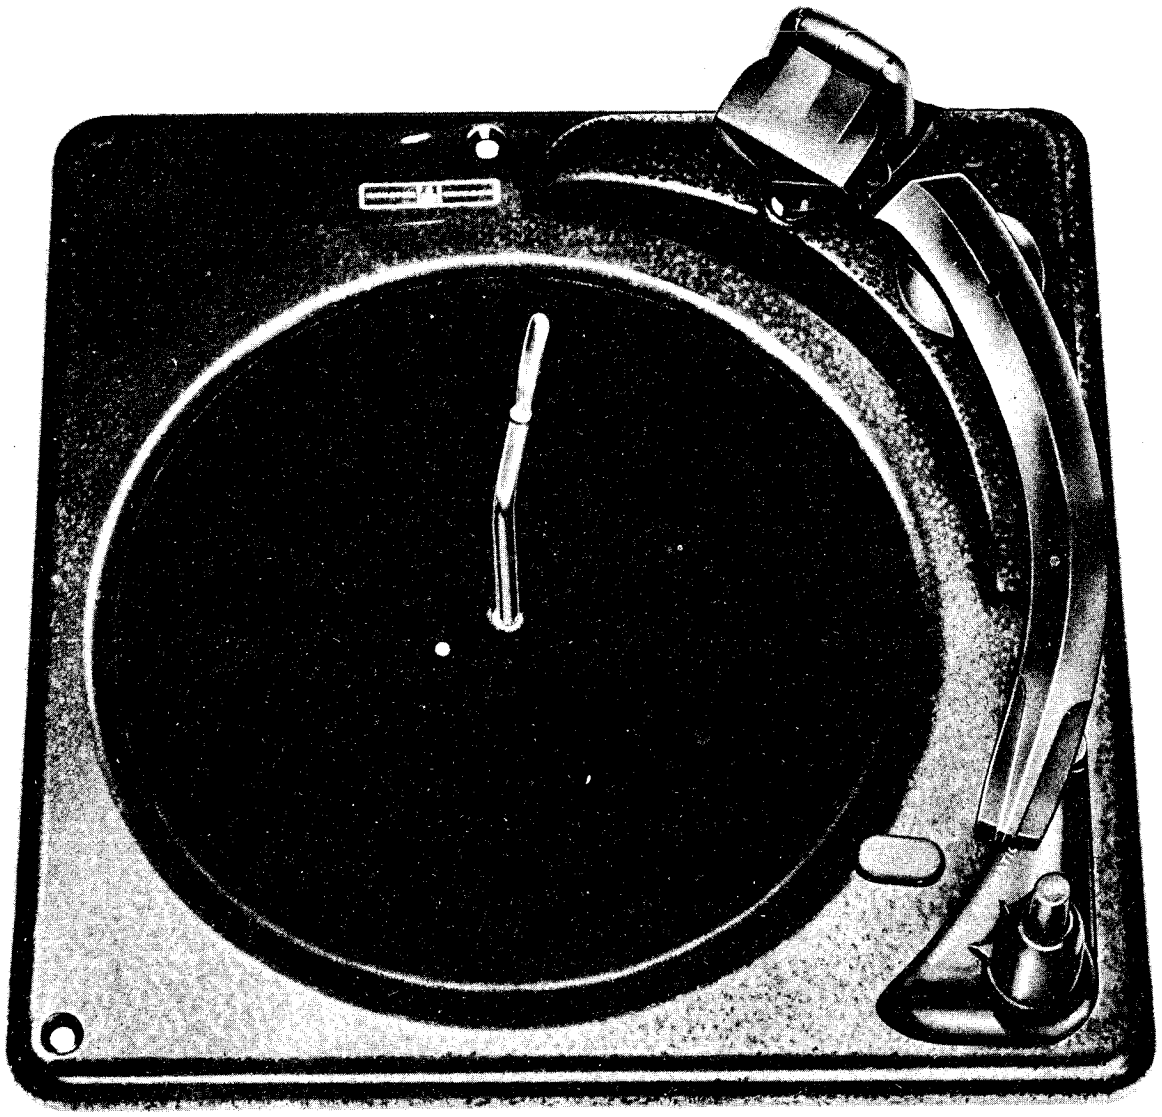

FIG. 1 - MODEL 56 RECORD CHANGER

I MODEL 56 RECORD CHANGER

The Webster Model 56 is a single post, Spring Cushioned Spindle, Automatic Record Changer. Simple in design and operation, it provides manual or automatic playing of standard ten or twelve inch records with a minimum of waiting time between records during automatic operation. Home recording or "Inside Out" records up to the 12 inch size may be played manually. This machine will change warped or rough-edged records, at the same time assuring maximum protection to the finest discs. Model 56 automatically shuts off after the last record has been played.

II OPERATION

A - MOTOR

Connect the motor cord to a source of 105-125 volt 60 cycle current only. For 105-125 volt 50 cycle operation, a special motor pulley (Part 17x412-4) must be used in place of the one supplied with the changer in order to drive the turntable at the required speed of 78 R.P.M.

Do not under any circumstances connect the motor to a source of direct current or alternating current of any other frequencies.

B - PICKUP

The pickup cartridge supplied with this unit is of the high impedance crystal type. This means that it may be connected to the average amplifier, radio set or public address system without using coupling transformers or impedance matching devices. Generally speaking, it is customary to connect the crystal from grid to ground of the first audio tube so that at least two stages of amplification are available. Most modern radio receivers have the volume control in the audio circuit and in such cases, the pickup may be connected directly across the volume control. In radio receivers having other than the audio type control, an auxiliary control will be required to adjust the record volume.

©John F. Rider

B - PICKUP - Cont'd.

The crystal supplied with this unit may be of the fixed permanent point or the removable needle type. If it is the latter, use a needle which is not more than 11/16 inches long for most satisfactory results.

The choice of a needle is largely a matter of personal preference since all needles have their good features.

There are many types of permanent point needles available for use with automatic record players. These may be straight shank, offset, solid or hollow shank, floating point, jewell or hard metal point types.

Some desirable qualities of a good needle are faithful reproduction, low surface scratch or hiss, long wearing qualities, minimum record wear and rugged construction.

Do not use single play or cactus needles for Automatic Operation.

C - OPERATION - Automatic

1 - Turn the Record Selector Post to TEN or TWELVE for ten or twelve inch records.

2 - Turn the Selector Switch (sleeve of ON button) to AUTOMATIC.

3 - With the Record Ballast Weight turned back, place up to ten 12" records, or twelve 10" records on the spindle so that the bottom record rests on the step of the spindle and the shelf of the Record Selector Post.

4 - Turn the Record Ballast Weight forward to rest on the top record.

5 - Press the ON button.

To reject any record while playing in the AUTOMATIC position, press the ON button.

NOTE: The OFF button may be pressed during any portion of the change cycle. The Pickup Arm may be moved manually at any time without damage to the mechanism. However, after the last record has been played, the Pickup Arm is automatically locked in position and should not be handled until it has come to rest on the OFF button.

6 - After the last record has been played, the entire stack may be removed from the turntable at one time. The simplest procedure is as follows:

a - Turn the Record Ballast Weight back out of position.

b - Place the fingers of both hands under opposite edges of the bottom record.

c - Do not apply pressure to the top record. (Keep your thumbs free.)

d - Lift the stack of records straight up, following the contours of the spindle. This permits the stack of records to follow the curve of the spindle without binding and greatly facilitates the removal of the stack.

D - OPERATION - Manual

1 - Turn the Record Selector Post to the TWELVE inch position. (This is not essential but permits more clearance in loading and unloading records.)

2 - Turn the Selector Switch (sleeve of ON button) to MANUAL.

3 - Place a record on the turntable. It may facilitate this operation if the record is placed over the spindle at an angle, with the edge of the record held below the level of the Record Selector Post Shelf. Records may be removed in the same manner.

4 - Press the ON button.

5 - Place the needle gently on the edge of the record. Do not lift the pickup arm too high as this will cause it to catch in the Automatic Stop Lock position. Particular care should be exercised if your pickup has a sapphire point needle. Although the sapphire is very hard and long wearing, it is extremely brittle and may be fractured or chipped if dropped on the record.

6 - To stop the mechanism at any time, press the OFF button.

III SERVICE INFORMATION

This unit has been accurately adjusted, lubricated and tested at the factory and should require no further adjusting in the field. If service repairs become necessary, this bulletin should be studied carefully before making any adjustments or replacing parts.

Service parts are available at the factory. All parts must be ordered by Part Number, Model Number and production number stamped on the under side of the main plate.

IV SERVICE REPAIRS

Service repairs and adjustment on the Model 56, listed by the apparent condition are as follows:

A - AUTOMATIC TRIP FAILS TO FUNCTION

When the movement of the pickup arm toward the spindle is greater than 1/8 inch in 1/2 revolution of the turntable, the Automatic Trip Arm trips the Velocity Trip and Roller Assembly. This releases the Actuating Pawl on the Main Cam Assembly, allowing it to engage the Main Cam Actuating Gear and driving the mechanism through the change cycle.

A - AUTOMATIC TRIP FAILS TO FUNCTION - Cont'd.

The automatic trip arm follows the movement of the pickup arm through a spring compression clutch. This clutch must be kept free of oil or grease.

Should it become necessary to clean the clutch, loosen the lock (Point "A" Figure 8) to relieve the spring tension and clean the clutch parts with carbon tetrachloride. Reset the clutch spring tension by setting the lock at least 1/4 inch below the main plate. This tension should be just sufficient to operate the trip mechanism without placing undue drag on the movement of the pickup arm.

Also check for:

1 - Velocity Trip and Roller assembly binding (Illus. 51 Fig. 7).

2 - Actuating pawl stuck. (Part of Main Cam assembly, Illus. 49 Fig. 7, engaged by hook end of Velocity Trip and Roller Assembly.)

3 - Automatic Trip Arm (Illus. 33 Fig. 6) bent and not hitting the Velocity Trip and Roller assembly.

4 - Insufficient compression on clutch spring (Illus. 32 Fig. 6).

5 - Manual Trip Lever binding at rivet (Illus. 36 Fig. 6).

6 - Manual Trip Lever rubbing on switch mounting bracket.

7 - No velocity lead-in groove or eccentric groove in center of record.

8 - Foreign matter in record groove.

9 - Badly worn record.

10 - Badly worn or bent needle.

B - MANUAL TRIP FAILS TO FUNCTION

The manual trip is operated by the ON button. When the button is pressed, the Manual Trip Lever is actuated, tripping the Velocity Trip and Roller Assembly and putting the mechanism in cycle.

1 - Manual Trip Lever (Illus. 36 Fig. 6) hair spring bent or broken.

2 - Velocity Trip and Roller Assembly binding (Illus. 51 Fig. 7).

3 - Actuating pawl stuck.

C - NEEDLE SKIPS GROOVE

With the pickup arm in playing position, the arm is practically free-floating on its pivot. There is no lead-in spring which might drag the needle over the first few grooves of the record or minimum radius device to jam the arm on the inside grooves.

The pressure required to actuate the trip mechanism is negligible.

Should the needle skip grooves at any time, check for:

1 - Record Changer not level.

2 - Pickup Arm binding.

3 - Foreign matter in record groove.

4 - Pickup cord pulled too tight or caught in hinge assembly.

5 - Badly worn record groove.

6 - Badly worn or bent needle.

D - MECHANISM CONTINUES TO CYCLE

At the completion of the change cycle the actuating pawl is engaged by the hook end of the Velocity trip and Roller Assembly which has been returned to its normal position by the reset points on the main cam drive gear. This hook should be adjusted for about .005 - .015 clearance from the bottom of the main cam drive gear. Greater clearance may permit the pawl to bounce past the hook and re-engage. Also check for:

1 - Velocity Trip and Roller Assembly (Illus. 51 Fig. 7.) rubbing on Main Cam Actuating gear (Illus. 50 Fig. 7).

2 - Manual Trip Lever (Illus. 36 Fig. 6.) binding at rivet.

3 - Hook end of Velocity Trip and Roller assembly bent and not engaging pawl.

4 - Bakelite disengage roller broken on Velocity Trip and Roller Assembly.

E - CONTINUES TO PLAY LAST RECORD AND DOES NOT SHUT OFF

1 - Check floating spindle to be sure that it moves up and down freely.

2 - With no records on spindle, check Automatic Shut Off Lock Lever (Point B, Fig. 8.) Hook end of this arm should catch the Pickup Arm Raising Disc at the beginning of the cycle to prevent travel of the arm and to cause it to drop on the OFF button. With no records on the Spindle, this hook should clear the Pickup Arm Raising Disc by 1/32 inch with the mechanism at rest. Bend lip (Point G Fig. 8) if necessary to make this adjustment. Do not attempt to move Pickup Arm Raising Disc up or down.

F - MOTOR DOES NOT SHUT OFF

1 - OFF button stuck.

2 - Defective switch mechanism.

3 - Defective switch.

NOTE - Do not attempt repairs on the Switch Mechanism or the Switch. If either becomes

©John F. Rider

©John F. Rider

defective, the entire assembly should be replaced.

G - PICKUP ARM LIFT TOO HIGH OR TOO LOW

1 - The needle should approach the top record of a full stack on the turntable with approximately 1/8 inch clearance. Adjust by bending the Pickup Arm Raising Lever at Point C., Fig. 8. Do not attempt to move Pickup Arm Raising Disc up or down.

H - NEEDLE LET DOWN INDEXING INCORRECT

The eccentric screw, accessible through the top of the Pickup Arm, should take care of any normal adjustment. Turn this screw clockwise to index the needle in toward the spindle and counter-clockwise to index the needle out away from the spindle.

Should further adjustment be necessary; proceed as follows:

1 - Set the Record Selector Post to the TEN inch position.

2 - Operate the mechanism by revolving the turntable manually until the needle drops to within 1/8 inch of a ten inch record on the turntable.

3 - With a #8 Bristol wrench in each of the set screws (Points D and E, Fig. 8) alternately loosen one and tighten the other until the needle rests above the record lead-in groove at the desired point.

4 - Turn the Record Selector Post to TWELVE and check the needle drop on a twelve inch record.

5 - Be sure that both set screws are tight when this adjustment is completed.

I - PICKUP ARM DROPS OFF "OFF" BUTTON

When the Pickup Arm is indexed to the OFF position, the lip of the Pickup Arm Raising Disc rests in the groove formed by the inside bevel of the lower Pickup Arm Pivot Shaft Bracket touching the Stud post. (Fig. 8) On units prior to Production No. 375614 this function was performed by a chamfered and grooved collar on the stud post.

Adjust the position of the bracket (or collar) so that the lip of the Pickup Arm Raising Disc rests in the groove with the Pickup Arm Pivot Shaft touching the sub plate. When properly adjusted, there should be .010 clearance between the lip of the Pickup Arm Raising Disc and the bottom of the groove. The position of the Pickup Arm on the Off Button is adjusted by bending the lip of the Pickup Arm Raising Disc, so that when the Pickup Arm is resting on the Off Button, the lip of the Pickup Arm Disc rests in the groove formed by the bracket and stud. After making this adjustment, check the set-down of the needle on a 12" record to be certain that the lip of the Pickup Arm Raising Disc does not hit the beveled side of this bracket.

J - RECORD SELECTOR POST ANGLE INCORRECT

The Record Selector Post should be so adjusted that the curve of the shelf matches the curve of the record. To adjust this angle:

1 - Turn the Record Selector Post to the TEN inch position.

2 - Place a ten inch record on spindle in the normal position for automatic playing.

3 - With a #8 Bristol wrench in each of the set screws (Point H and J, Fig. 8) alternately loosen one and tighten the other until the Record Selector post angle is correct. Be sure that both set screws are tight at the completion of this adjustment.

K - SPINDLE DROPS MORE THAN ONE RECORD

The floating latch at the top of the spindle is so spaced that only one record at a time can slide between the heel of the latch and the step of the spindle. The hole in the latch is elongated so that the latch can slip into the spindle recess when records are being removed.

If more than one record is dropped at a time, it will be found to be due to

1 - Foreign matter in spindle recess causing the latch to stick.

2 - Exceptionally thin records. Standard records are 0.070 to 0.100 in thickness.

L - RECORD DROPS ON PICKUP ARM

As the change cycle is started by the needle being on the center lead-in groove of the record, the first motion of the cam causes the Record Selector Post to move toward the spindle about 3/32 inches. This position is maintained until the Pickup Arm has made its full lateral excursion at which time the Record Selector Post again moves toward the spindle, causing the bottom record to drop into playing position.

If the Record Selector Post has been bent back, away from the spindle, it is possible for a standard record to rest on the spindle step with its edge just over the edge of the Record Selector Post shelf. Then as the change cycle is started, the record is pushed off the spindle by the initial movement of the Record Selector Post, so that it drops on the Pickup Arm.

To correct this condition, the Rocker Arm Assembly must be bent so that the Record Selector Post is brought nearer to the spindle.

1 - With the mechanism at rest, wedge the Rocker Arm firmly by inserting a screwdriver between the Rocker Arm and the Sub Plate at a point between the Rocker Arm Pivot (Illus. 43 Fig. 5) and the stud.

2 - With the heel of the hand, press the Record Selector Post toward the spindle, so that a standard record rests

©John F. Rider

at least half way over the Record Selector Post ledge when placed on the spindle step.

It is recommended that the distance between the edge of the record and the step of the Record Selector Post be held to 1/32 of an inch so that records with rough or sharply beveled edges will not catch on the outer edge of the Record Selector Post.

CAUTION: Be certain that a standard size record is used in making this adjustment. A standard 10" record measures 9-7/8" ± 1/32" dia. A standard 12" record measures 11-7/8" ± 1/32" dia.

V LUBRICATION

Model 56 Record Changer leaves the factory completely oiled and lubricated. Under normal conditions this should be sufficient for approximately one year or 1,000 hours of operation. When operated under extreme conditions of dust or heat, this operation should be performed more frequently as required.

NOTE: AVOID EXCESSIVE LUBRICATION.

Do not permit any oil or grease to get on the rubber idler drive wheel or the Motor Pulley (Illus. 15 and 29, Fig. 4), on turntable drive rim or on the automatic trip arm clutch. Any oil or grease on these points should be removed using Carbon Tetrachloride.

The recommended lubricants and points of lubrication are as follows:

A - #10 Oil (apply with small oil can or medicine dropper)

1 - Motor Bearings. Saturate top and bottom felts.

2 - Pickup Arm Shaft (Illus. 30 Fig. 6). Apply one drop each to bottom bearing point, bracket hole and hole through Main Base Plate.

3 - Ball Bearing Assembly (Illus. 12 Fig. 4).

4 - Idler Wheel Felt (Illus. 19 Fig. 4).

B - LUBRIPLATE (APPLY WITH SMALL BRUSH)

1 - Idler Wheel Link (Illus. 16 Fig. 4).

2 - Turntable Shaft Stud.

3 - Pickup Arm Hinge Pins (Illus. 7 Fig. 6).

4 - Knife edge of Raising Lever (Illus. 40 Fig. 7).

5 - Main Cam bearing. (It is necessary to remove the sub-plate assembly to lubriplate this bearing. See paragraph VI-C)

C - STA-PUT (APPLY WITH SMALL BRUSH)

1 - Teeth of Main Cam Actuating Gear (Illus. 50 Fig. 7).

2 - Track of Main Cam Gear (Illus. 49. Fig. 7).

3 - Teeth of Large and Small idler Gears (Illus. 13 Fig. 4).

4 - Raising Lever Bracker bearing surfaces (Illus. 39 Fig. 7).

5 - Selector Lever Stop (Illus. 48 Fig. 5).

VI MECHANICAL REPAIRS

A - TO REPLACE A PICKUP CARTRIDGE

A Pickup cartridge can be most easily replaced by first removing the Pickup Arm.

1 - Hold the Pickup Arm firmly with left hand.

2 - Using a tool such as a screwdriver, press in on one of the blue steel Pickup Arm hinge brackets while lifting up on the arm. (Fig. 3). This will release the Pickup Arm Hinge pin.

3 - Repeat on the other pickup arm bracket.

4 - The Pickup Arm, when released from the hinge brackets, may then be turned over and laid on the turntable for easy access to the cartridge.

On the models later than Production No.375614 a spring is inserted between the pins of the Hinge Bracket. This spring must be removed before the hinge can be taken apart.

B - TO REPLACE THE PICKUP ARM

The Pickup Arm may be replaced on its bracket without the use of tools.

1 - Line up the guide slots in the Shaft Bracket; with the pins in the Pickup Arm Bracket.

2 - Hook the roller (on the rear of the hinge assembly) under the Pickup Arm Lift Stop Bracket (under the Crescent Assembly) keeping the guide slots and pins in line.

In performing this operation, be sure that the pickup cord lies outside of the hinge and does not become wedged in the bracket.

3 - Press down firmly on the Pickup Arm base until the hinge pins fall into the bracket holes. On models after Production No. 375614, the hinge should be re-assembled, using a pair of long-nosed pliers to place the Pickup Arm Hinge Bracket over the pins in the Shaft Bracket. The retaining spring need not be replaced unless the unit is to be reshipped.

C - TO REMOVE THE SUB-PLATE ASSEMBLY

In the event that it becomes necessary to replace any of the major parts in the sub-plate assembly (Fig. 7) the entire assembly should first be removed from the main plate.

WEBSTER CHICAGO CORP.

C - TO REMOVE THE SUB-PLATE ASSEMBLY - Cont'd.

1 - Remove the spindle which is held in by a cotter pin under the sub-plate.

2 - Remove the Turntable.

3 - Remove the Pickup Arm.

4 - Unhook the Rocker Arm Return Spring.

5 - Remove the Rocker Arm Pivot Pin.

6 - Remove the five #8-32x1/4 screws holding the sub-plate studs and the #8-32x3/8 screw holding the center post to the main plate.

NOTE that one of the 8-32x1/4 screws is accessible through the Pickup Arm hole in the Crescent Assembly.

It should not be necessary to remove the Crescent Assembly except for replacement or to remove the complete Rocker Arm Assembly.

D - TO REPLACE THE SUB-PLATE ASSEMBLY

Reverse the above procedure making certain that all parts fall into their proper positions. Particularly note The Selector Lever and Selector Lever Compression Spring to see that they are in position with the lever through the slot in the Pickup Arm Raising Lever Bracket.

E - TO REMOVE THE RECORD POST AND ROCKER ARM ASSEMBLY

1 - Remove the Pickup Arm Assembly.

2 - Remove the four nuts under the main plate which hold the Crescent Assembly.

3 - Unhook the Rocker Arm Return Spring. (Illus. 44 Fig. 5).

4 - Remove the Rocker Arm Pivot Pin. (Illus. 43 Fig. 5).

5 - Lift out the Selector Post, Rocker Arm and Crescent Assembly as a unit.

6 - In replacing the Rocker Arm assembly, note paragraph VI, D "To Replace Sub-Plate Assembly."

ZENITH RADIO CORP.

GENERAL

TO THE SERVICE MAN:

This Service Manual has been prepared for the purpose of assisting the Service Man in his work of caring for the Record Changer mechanism, whether he is called to remedy some difficulty, or to insure its continued satisfactory operation. The Zenith Automatic-Record Changers are constructed with a minimum of working parts, and in operation are simple and reliable. However, as is the case with all mechanical units, misalignment and trouble may occasionally develop. The information presented in this book will enable the Service Man to render quick and accurate service. For convenience, the Operating Instructions supplied with each Record Changer are summarized as follows:

The Record Changer will automatically play up to twelve 10 inch or ten 12 inch records at one loading. The Record Stack rests on the Spindle and the Record Shelf. The Selector Sprocket drives the Ejector Plate which pushes the records off the Shelf and Spindle allowing them to drop on the Turntable. To load for automatic operation, set the Record Size Selector Knob to 10 or 12, raise the Pressure Bar, press down lightly and turn the Spindle counter-clockwise to the load position, place the stack of records on the Spindle, lower the Pressure Bar until it rests on the Record Stack. Set the AUTO-MAN-OFF switch to AUTO and press the Record Change button. The Changer will play the entire selection of records and will repeat the last record until it is turned off. For manual operation set the AUTO-MAN-OFF switch to MAN and play the records singly as on a non-automatic record player.

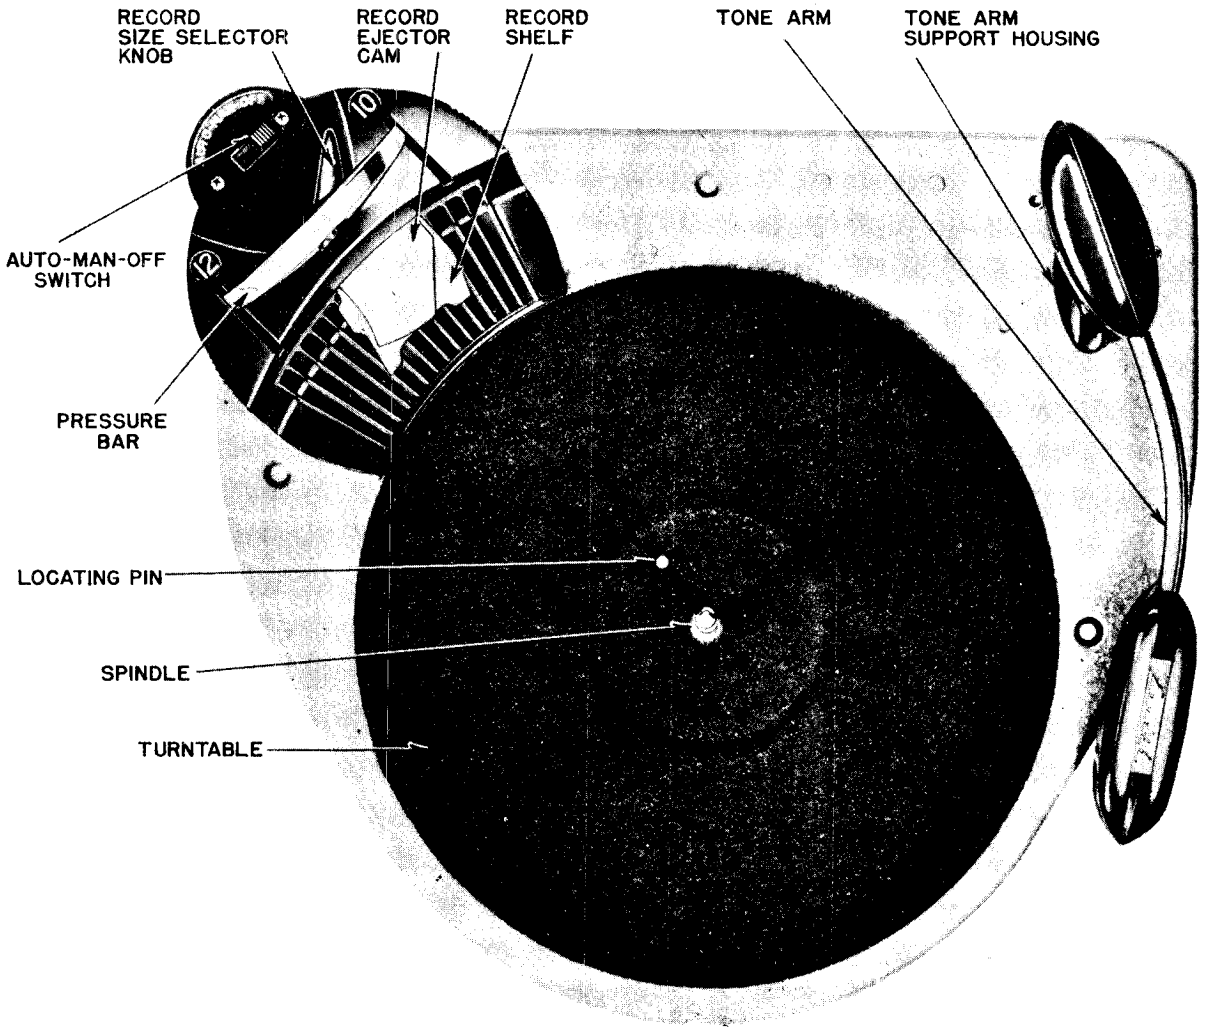

Fig. 1. Top View of Record Changer.

©John F. Rider

ZENITH RADIO CORP.

DESCRIPTION OF CYCLING

The Motor drives an Idler Wheel which rim drives the Turntable and the upper section of the Clutch mechanism. The Spindle is fixed and does not turn with the Turntable.

When the Record Changer button on the receiver panel is pressed, an electric circuit is completed through the Solenoid (the current being supplied by a winding on the motor) causing the solenoid armature to trip. This action engages the lower section of the Clutch with the rotating upper section. (After the Clutch is tripped a cut-out switch in the solenoid circuit is opened, breaking the current flow through it, eliminating chatter.) When the Clutch is engaged the Turntable turns the Drive Sprocket and the Chain. The Chain turns the Timing Sprocket which, due to its construction, pushes the Lift Pin up and raises the Tone Arm off the record. The Locating Bushing Pin on the Timing Sprocket then engages the Tone Arm Control Lever which swings the Tone Arm clear of the record. (The action of the Locating Pin and Bushing against the Tone Arm Control Lever governs the lateral swing of the Tone Arm. For 12 inch records the small diameter Pin rides against the Tone Arm Control Lever and the Bushing drops to the lower end of the pin out of contact with the Tone Arm Control Lever. However, on 10 inch records the landing position of the Tone Arm is one inch nearer the Spindle than for 12 inch records, and the bushing, which has a greater diameter, is pushed upward by the Record Size Lever until it rides against the Tone Arm Control Lever giving the Tone Arm an additional swing for 10 inch records.)

When the Timing Sprocket is turned, the Selector Sprocket, which operates the Record Ejector Cam is also turned, causing the record to be pushed off the Spindle and dropping on the Turntable. After one-half cycle, an emboss on the Timing Sprocket re-sets the clutch trigger mechanism and closes the anti-chatter switch. The Locating Bushing Pin then brings the Tone Arm over the starting groove of the record, and the Lift Pin slides into its groove in the Timing Sprocket, lowering the Tone Arm on the record. At the same time the Lift Pin slides into its groove, a slot in the Timing Sprocket approaches the Clutch Release Lever and when the tip of the Clutch Release Lever drops into this slot the Clutch is disengaged.

As the record is played the Tone Arm is gradually moving toward the center of the record and a Pawl attached to the Tone Arm Control Lever is moving toward the Cycling Switch Trip Lever. When the record has finished its play, the needle enters the eccentric groove and the Pawl engages the Cycling Switch Trip lever. The oscillating action of the Pawl against the Cycling Switch Trip Lever causes the Cycling Switch to close, complete the circuit, and start the cycle over again. If the record does not have an eccentric groove, the Position Trip will close the Cycling Switch and start the next cycle.

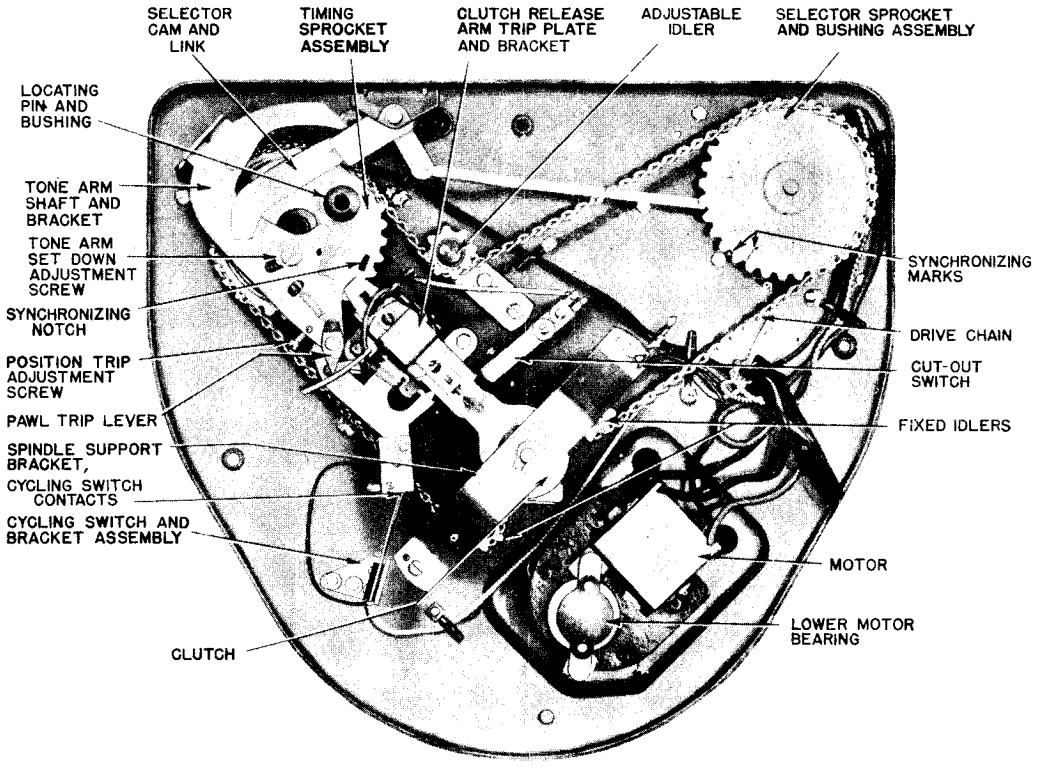

Fig. 2. Bottom View of Record Changer.

ZENITH RADIO CORP.

LUBRICATION

Figures 3 and 4 indicate the points to be lubricated and the type of lubricant to use. The Motor has two oil wicks that should be saturated with oil. The Record Spindle Guide Bearing, Idler Wheel Bearing, Lower Drive Shaft Bearing, Drive Shaft Thrust Bearing and the Motor Bearings are of

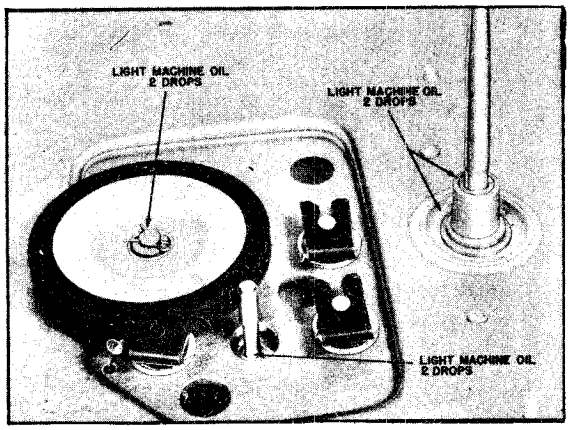

Fig. 3. Lubrication Top of Record Changer.

the OILITE type and require very little attention. If squeaks develop, make certain that they are not caused by friction between the Spindle and records on the Turntable. A thin coat of wax on the Spindle will remedy this condition.

ADJUSTMENTS

1. Tone Arm Set Down Adjustment.

Before the set down adjustment is made, study Figure 5 and proceed as follows:

a. Set the Record Size Selector Knob to 12.

b. Place a standard 12 inch record on the Turntable.

c. Trip the Clutch by hand and turn the turntable clockwise **until** the tone arm just starts to come down on the record.

d. Loosen the Tone Arm Adjustment Lock Screw on the Tone Arm Control Lever "D."

e. Remove the Lift Pin "E."

f. Move the Tone Arm until the Tone Arm Control Lever and the Locating Bushing Pin are in contact "B."

g. While holding the Tone Arm Control Lever against the Locating Bushing Pin, set the needle on the record about

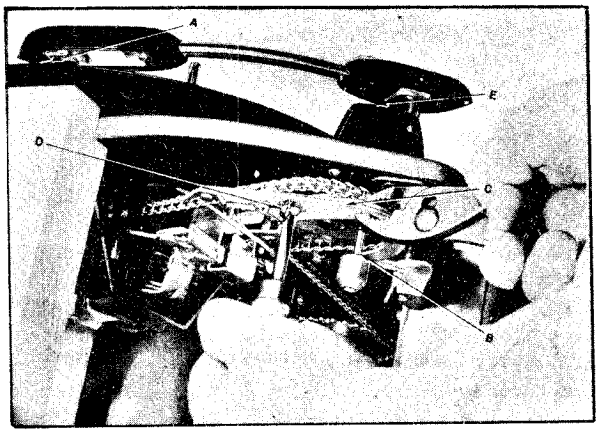

Fig. 5. Tone Arm Set Down Adjustment.

1-32" from where the run-in groove ends and the playing grooves begin "A," grasp the Tone Arm Control Lever with

ZENITH RADIO CORP.

pliers "C" and tighten the Tone Arm Adjustment Lock Screw "D."

h. Replace Lift Pin and check operation on 10 and 12 inch records.

i. An alternate method for making the adjustment is to loosen and move the Tone Arm Adjustment Lock Screw "D" in its slot inward to bring the Tone Arm in, or outward to bring it out, determining the proper amount experimentally.

2. Tone Arm Height Adjustment.

The Tone Arm vertical rise is governed by the Lift Pin. The Lift Pin is adjustable (see Fig. 6). Too long a Lift Pin will cause the Tone Arm to hit the underside of the records on the Spindle. If the Lift Pin is short the needle will not clear twelve records on the Turntable. To make the proper adjustment, trip the Clutch by hand and rotate the Turntable clockwise until the Tone Arm starts to swing toward the Spindle. Gently push the Tone Arm as close to the Spindle as it will go, place a record on the Spindle and observe the spacing between it and the Tone Arm. The spacing "A" should be approximately the thickness of a record. If the spacing is incorrect, lift the Tone Arm, remove the Lift Pin, loosen the Lock Nut and adjust the Lift Pin to the proper length. Make certain that the Lock Nut is tightened after adjustment.

Fig. 6. Lift Pin.

3. Cycling Switch Adjustment.

When a record has completed its play and the needle enters the eccentric groove, Pawl "C" engages the Trip Plate "D," closing contacts "A" and completing the circuit through the solenoid which trips the record change mechanism.

To adjust the Cycling Switch, move the Tone Arm until Pawl "C" is clear of the Trip Lever Plate "D" (as shown in Fig. 8). Loosen the two Lock Screws "B", move the Cycling Switch bracket until there is approximately .02 inch spacing between contacts "A" and tighten the Lock Screws.

4. Position Trip Adjustment.

The Position Trip does not depend on an eccentric groove in the record to start the record change cycle, but will trip the mechanism whenever the needle comes within a pre-determined distance from the Spindle. Older type records that do not have an eccentric groove can in most cases be played automatically by the proper adjustment of the Position Trip. Under normal conditions with the needle approximately 1¾" from the center of the Spindle adjust "E" (Fig. 8) until the contacts "A" close. This distance is generally satisfactory since no modern record will be cut off before it has completed its play, and none will fail to trip the mechanism at the end. In special cases screw the adjustment "E" clockwise for earlier tripping and counter-clockwise for later tripping as the individual cases may be.

It may be impossible to find an adjustment that will always trip the mechanism and never cut off all type records, and in these special cases the record must be played manually.

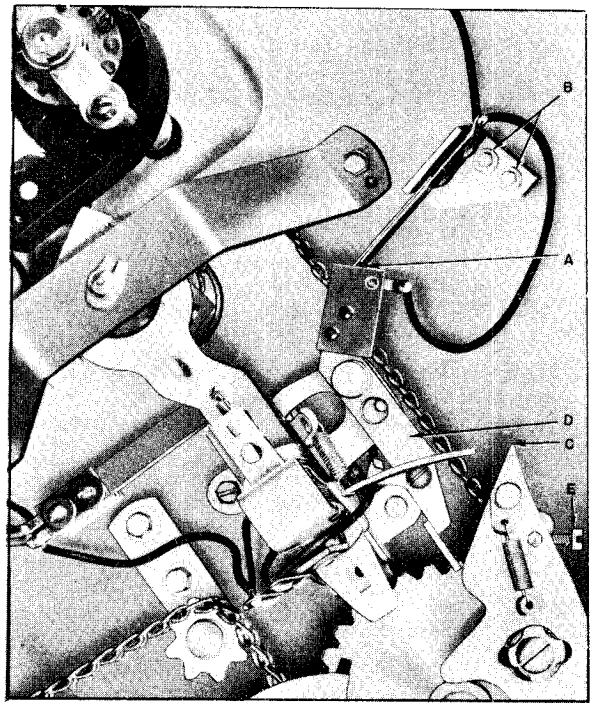

Fig. 8. Cycling Switch and Position Trip Adjustments.

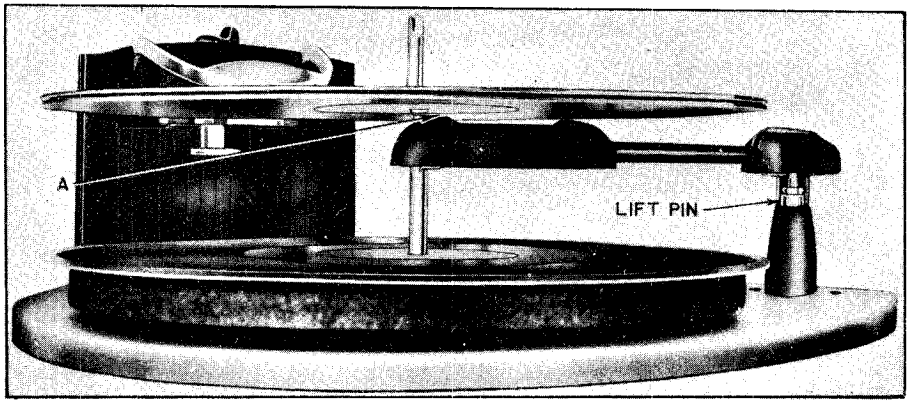

Fig. 7. Tone Arm Height Adjustment.

ZENITH RADIO CORP.

REMOVING THE TURNTABLE

To remove the Turntable, hold the Clutch with one hand, and turn the Turntable with the other (see Fig. 9).

To avoid damage when the Turntable is replaced, make certain that the Idler Wheel is pushed inside the rim before the Turntable is seated.

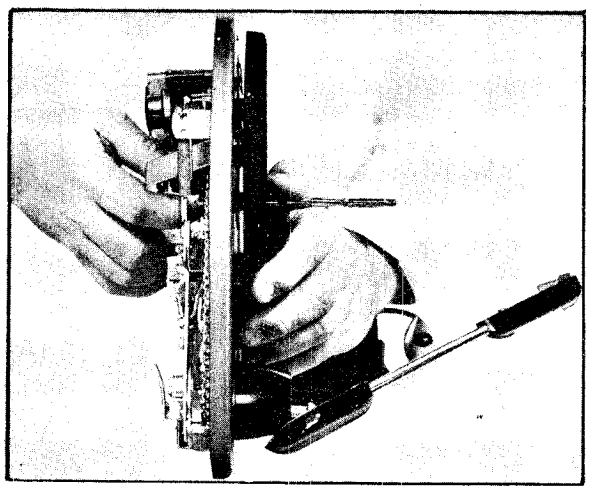

Fig. 9. Removing the Turntable.

REPLACING THE MOTOR

The Motor is designed for operation on 50 or 60 cycle Alternating Current (AC) depending on the spring bushing installed on its shaft. For 50 cycle operation a 80-452 spring bushing is used. For 60 cycle, use a 80-453 bushing. For operation on 25 cycle current a 25 cycle motor must be installed. When a replacement Motor is ordered, make certain that the line voltage and frequency of the receiver are given.

To replace the Motor, unsolder the connecting leads, remove the Turntable, the three spring mounting clips and allow the Motor to drop out. Remove the spring bushing from the shaft of the defective Motor and install it on the new one. When the new Motor is installed do not draw the connecting leads tight as this will prevent the Motor from "floating" on its spring mounts. Make certain that all the leads are securely soldered and taped.

REPLACING THE CHAIN

To replace the Chain, loosen the adjustable idler (see Fig. 10) and remove the Chain. Open a link, and pull the Chain out. Open a link in the replacement Chain and thread it in place making certain that the open ends of the links face outward from the Base Plate (see Fig. 2). (This will prevent the Chain from being installed in reverse.) Carefully close the link in the new Chain and make certain that there is no stiffness in its action. Read the paragraph on synchronization before the Chain is permanently installed.

SYNCHRONIZATION

When the Chain is removed or replaced, the Timing Sprocket and the Selector Sprocket must be synchronized. The Selector Sprocket has a synchronizing mark that must line up with the mark on the Base Plate (see Fig. 2). The Timing Sprocket has a small slot. The Clutch Release Lever Tip must drop into this slot at the same time the Selector Sprocket is lined up with the synchronizing mark on the Base Plate (Fig. 2). To sychcronize hold the Timing Sprocket and Selector Sprocket in position, thread the chain over the Drive Sprocket, two fixed idlers, Timing Sprocket, Selector Sprocket and over the adjustable idler. Set the adjustable idler for medium tension on the Chain and tighten the two holding screws.

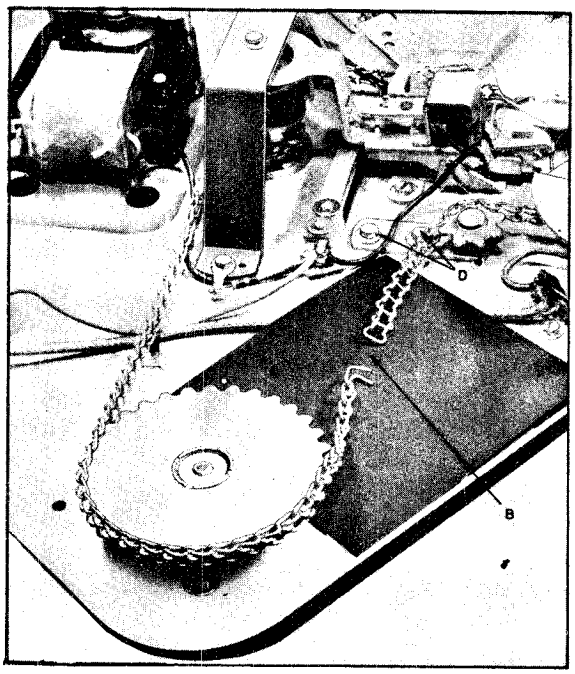

Fig. 10. Replacing the Chain.

TROUBLE SHOOTING

SQUEAKS OR NOISES DURING PLAYING OF RECORDS.

a. Friction between the records on the turntable and the spindle will occasionally cause squeaks. A thin coat of wax applied to the spindle will remedy this condition.

b. Check lubrication.

MECHANISM STARTS SLOWLY AND MOTOR GETS HOT.

a. Check line voltage and frequency.
b. Check lubrication.
c. Motor windings damaged.
d. Toom temperature abnormally low.

PRESSING RECORD CHANGE BUTTON ON RECEIVER PANEL DOES NOT START RECORD CHANGE CYCLE.

a. See that the AUTO-MAN-OFF switch is set to AUTO.
b. Check Record Change Switch.
c. Check Muting Switch.
d. Check electrical continuity of solenoid circuit.
e. Check solenoid energizing voltage on motor.

©John F. Rider

MODEL S-11468

MOTOR FAILS TO RUN EVEN WHEN IT IS ENTIRELY DISCONNECTED FROM CHANGER AND PROPER VOLTAGE AND FREQUENCY APPLIED DIRECTLY TO THE TWO INPUT LEADS OF THE WINDING.

a. Open windings.
b. Damaged or frozen bearings.

RUMBLE AND MICROPHONICS DURING REPRODUCTION.

a. Changer not "floated" properly. Loosen mounting bolts.
b. Motor mounting Spring Clips rubbing on the idler wheel.
c. Motor leads pulled tight preventing motor from "floating" freely on its spring.

NEEDLE SETS DOWN PROPERLY ON REORD BUT SLIDES OVER THE RECORD GROOVES.

a. Cabinet tilted.
b. Badly worn needle.

NEEDLE FAILS TO CLEAR MAXIMUM LOAD OF RECORDS ON THE TURNTABLE.

a. Check Tone Arm height adjustment No. 2.

CHANGER CYCLES WITH AUTO-MAN-OFF SWITCH ON MAN.

a. Check AUTO-MAN-OFF switch.

TONE ARM FALLS OFF RECORD.

a. Check Tone Arm set down adjustment screw.
b. Check Tone Arm mounting screws.

RECORD IS NOT HEARD ALTHOUGH CHANGER OPERATES.

a. See that the Phono Radio switch is on Phono.
b. Check receiver audio by listening to radio.
c. Check Crystal Pickup Cartridge.

TONE ARM SETS DOWN TOO FAR IN OR OUT ON RECORD.

a. Check Tone Arm set down adjustment No. 1.

CHANGER CONTINUES TO CYCLE.

a. Check Cycling switch adjustment.
b. Check Record Change switch.
c. Clutch release mechanism sticks.
d. Tight drive chain.

CHANGER WILL NOT CYCLE UPON COMPLETION OF RECORD.

a. See that the AUTO-MAN-OFF switch is set to AUTO.
b. Make certain the record has an eccentric center groove.
c. Check Cycling switch.
d. Check Cut-out switch.
e. Check Clutch Release Arm for freedom of action.

SQUEAKS WHEN CHANGER IS IN CYCLE.

a. Friction between Lift Pin and Timing Sprocket. Apply a thin coat of lubriplate.

FAILS TO EJECT RECORDS ACCOMPANIED BY A CLICKING SOUND.

a. Clutch slips. A slight upward bend of the Clutch trip lever will correct this condition.

TONE ARM STICKS OR HANGS UP DURING CYCLE.

a. Clutch Release Lever pressure on Timing Sprocket too great. Loosen the solenoid bracket and insert a very thin shim between it and the base plate. If the condition still prevails, increase the thickness of the shim.
b. Burrs in synchronizing notch or trip lever. Remove with a file.

TONE ARM SET-DOWN POSITION VARIES.

a. Loose Tone Arm set down adjustment lock screw.
b. Loose Tone Arm mounting screw.
c. Plastic Tone Arm housing broken.

ZENITH RADIO CORP.

DESCRIPTION OF CYCLING

The Motor drives an Idler Wheel which rim drives the Turntable and the lower section of the Clutch mechanism. The Spindle is fixed and does not turn with the Turntable.

When the Record Change button on the receiver panel is pressed, an electric circuit is completed through the Solenoid (the current being supplied by a winding on the motor) causing the solenoid armature to trip. This action engages the upper section of the Clutch with the rotating lower section. After the Clutch is tripped a cut-out switch in the solenoid circuit is opened breaking the current flow through it, eliminating chatter. When the Clutch is engaged the Turntable turns the Drive Sprocket and the Chain. The Chain turns the Timing Sprocket which, due to its construction, pushes the Lift Pin up and raises the Tone Arm off the record. The Locating Bushing Pin on the Timing Sprocket then engages the Tone Arm Control Lever which swings the Tone Arm clear of the record. (The action of the Locating Pin and Bushing against the Tone Arm Control Lever governs the lateral swing of the Tone Arm. For 12 inch records the small diameter Pin rides against the Tone Arm Control Lever and the Bushing drops to the lower end of the pin out of contact with the Tone Arm Control Lever. However, on 10 inch records the landing position of the Tone Arm is one inch nearer the Spindle than for 12 inch records, and the bushing, which has a greater diameter than the pin, is pushed upward by the Record Size Lever until it rides against the Tone Arm Control Lever giving the Tone Arm an additional swing for 10 inch records.

When the Timing Sprocket is turned, the Selector Sprocket, which operates the Record Ejector Cam is also turned, causing the record to be pushed off the Spindle, and to drop on the Turntable. After one-half cycle an emboss on the Timing Sprocket re-sets the clutch trigger mechanism and closes the cut-out switch. The Locating Bushing Pin brings the Tone Arm over the starting groove of the record and the Lift Pin slides into its groove in the Timing Sprocket, lowering the Tone Arm on the record. At the same time the Lift Pin slides into its groove, a slot in the Timing Sprocket approaches the Clutch Release Arm and when the tip of the Clutch Release Arm drops into this slot the Clutch is disengaged.

As the record is played the Tone Arm is gradually moving toward the center of the record and a Pawl attached to the Tone Arm Control Lever is moving toward the Cycling Switch Trip Lever. When the record has finished its play, the needle enters the eccentric groove and the Pawl engages the Cycling Switch Trip Lever. The oscillating action of the Pawl against the Cycling Switch Trip Lever causes

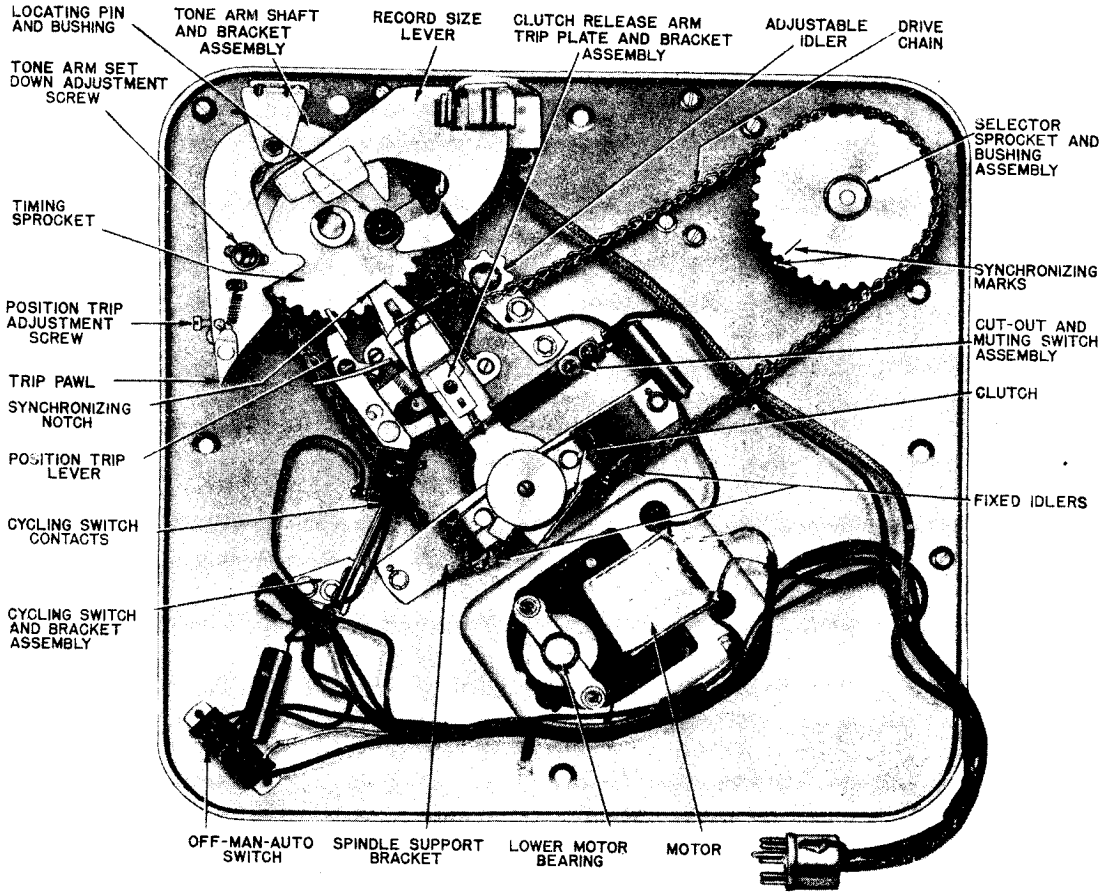

Fig. 2. Bottom View of Record Changer.

©John F. Rider

ZENITH RADIO CORP.

the Cycling Switch to close, completes the circuit, and start the cycle over again. If the record does not have an eccentric groove, the Position Trip will close the Cycling Switch and start the next cycle.

LUBRICATION

Figures 3 and 4 indicate the points to be lubricated and the type of lubricant to use. The Motor has two oil wicks that should be saturated with oil. The Record Spindle Guide Bearing, Idler Wheel Bearing, Lower Drive Shaft Bearing, Drive Shaft Thrust Bearing and the Motor Bearings are of the OILITE type and require very little attention. If squeaks develop, make certain that they are not caused by friction between the Spindle and records on the Turntable. A thin coat of wax on the Spindle will remedy this condition.

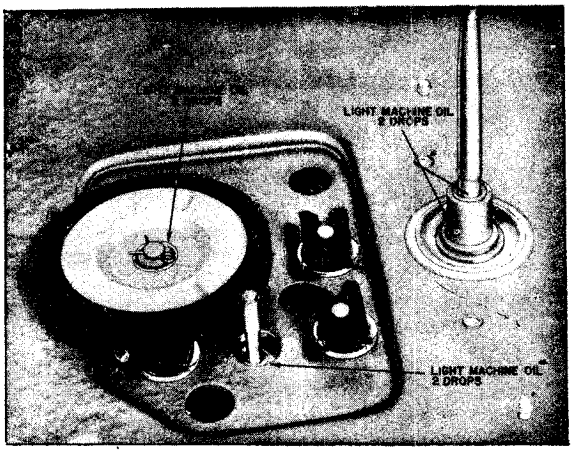

Fig. 3. Lubrication Top of Record Changer.

ADJUSTMENTS

1. TONE ARM SET DOWN ADJUSTMENT

Before the set down adjustment is made, study Figure 5 and proceed as follows:

a. Place a standard 12 inch record on the Turntable.

b. Trip the clutch by hand and turn the Turntable clockwise until the Tone Arm just starts to come down on the record.

c. Loosen the Tone Arm Adjustment Lock Screw on the Tone Arm Control Lever "D."

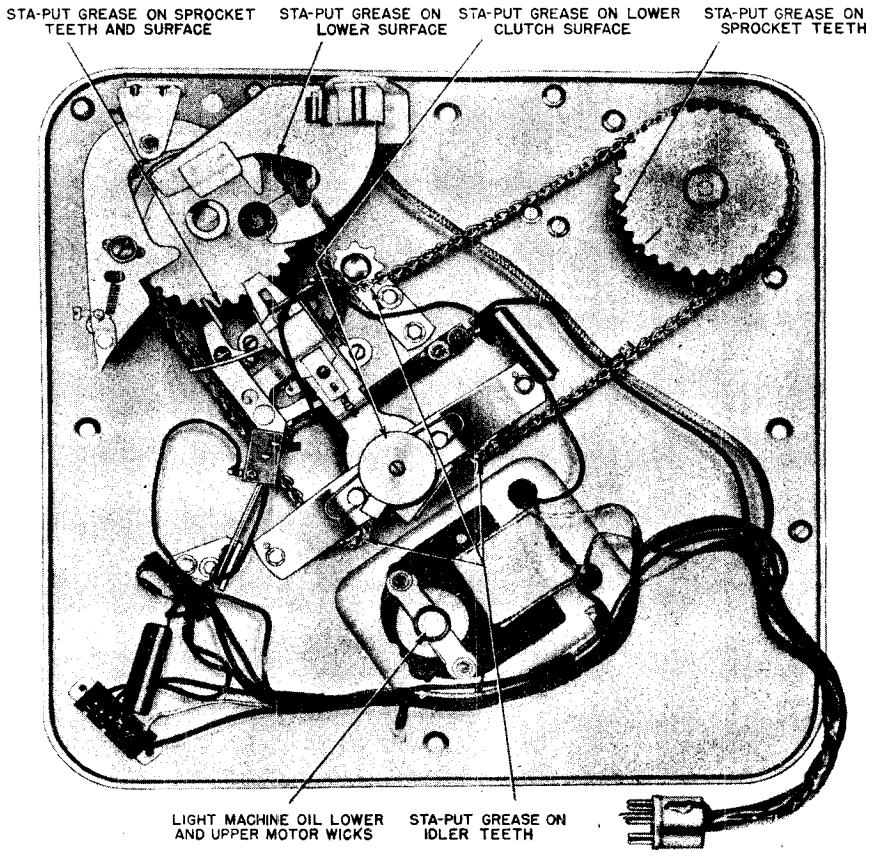
d. Remove the Lift Pin "E."

e. Move the Tone Arm until the Tone Arm Control Lever "Y" and the Locating Bushing Pin "X" are in contact "B."

f. While holding the Tone Arm Control Lever against the Locating Bushing Pin, set the needle on the record about 1/32" from where the run-in groove ends and the playing grooves begin "A," grasp the Tone Arm Control Lever with pliers "C" and tighten the Tone Arm Adjustment lock Screw "D."

g. Replace Lift Pin and check operation on 10 and 12 inch records.

h. In case the operation is repeated it will be necessary to trip the Automatic Record Size Selector (Fig. 1) by hand,



STA-PUT GREASE ON SPROCKET TEETH AND SURFACE
STA-PUT GREASE ON LOWER SURFACE
STA-PUT GREASE ON LOWER CLUTCH SURFACE
STA-PUT GREASE ON SPROCKET TEETH
LIGHT MACHINE OIL LOWER AND UPPER MOTOR WICKS
STA-PUT GREASE ON IDLER TEETH

Fig. 4. Lubrication Bottom of Record Changer.

©John F. Rider

ZENITH RADIO CORP.

otherwise the needle will land in the 10 inch position.

1. An alternate method for making the adjustment is to loosen and move the Tone Arm Lock Screw "D" in its slot inward to bring the Tone Arm in, or outward to bring it out, determining the proper amount experimentally.

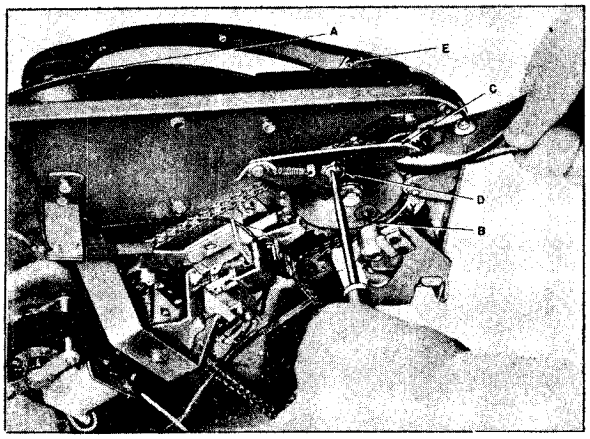


Fig. 5. Tone Arm Set Down Adjustment.

2. TONE ARM HEIGHT ADJUSTMENT

The Tone Arm vertical rise is governed by the Lift Pin. The Lift Pin is adjustable (see Fig. 6). Too long a Lift Pin will cause the Tone Arm to hit the underside of the records on the Spindle. If the Lift Pin is short the needle will not clear fourteen records on the Turntable. To make the proper adjustment, trip the Clutch by hand and rotate the Turntable clockwise until the Tone Arm starts to swing toward the Spindle. Gently push the Tone Arm as close to the Spindle as it will go, place a record on the Spindle and observe the spacing between it and the Tone Arm. The spacing "A" should be approximately the thickness of a record. If the spacing is incorrect, lift the Tone Arm, remove the Lift Pin, loosen the Lock Nut and adjust the Lift Pin to the proper length. Make certain that the Lock Nut is tightened after adjustment.

Fig. 6. Lift Pin.

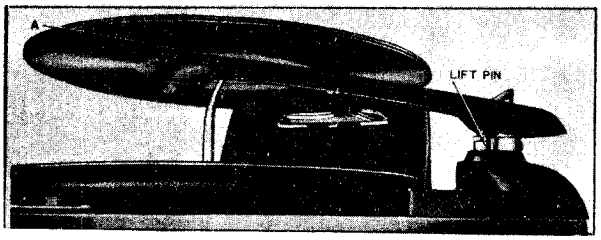

Fig. 7. Tone Arm Height Adjustment.

3. CYCLING SWITCH ADJUSTMENT

When a record has completed its play and the needle enters the eccentric groove, Pawl "C" engages the Trip Plate "D" closing contacts "A" and completing the circuit through the solenoid which trips the record change mechanism.

To adjust the Cycling Switch, move the Tone Arm until Pawl "C" is clear of the Trip Lever Plate "D" (as shown in Fig. 8). Loosen the two Lock Screws "B," move the Cycling Switch bracket until there is approximately .03 inch spacing between contacts "A" and tighten the Lock Screws.

4. POSITION TRIP ADJUSTMENT

The Position Trip does not depend on an eccentric groove in the record to start the record change cycle, but will trip the mechanism whenever the needle comes within a predetermined distance from the Spindle. Older type records that do not have an eccentric groove can in most cases be played automatically by the proper adjustment of the Position Trip. Under normal conditions with the needle approximately 1¾" from the center of the Spindle adjust "E" (Fig. 8) until the contacts "A" close. This distance is generally satisfactory since no modern record will be cut off before it has completed its play, and none will fail to trip the mechanism at the end. In special cases screw the adjustment "E" clockwise for earlier tripping and counterclockwise for later tripping as the individual case may be.

It may be impossible to find an adjustment that will always trip the mechanism and never cut off with all type records, and in these special cases the record must be played manually.

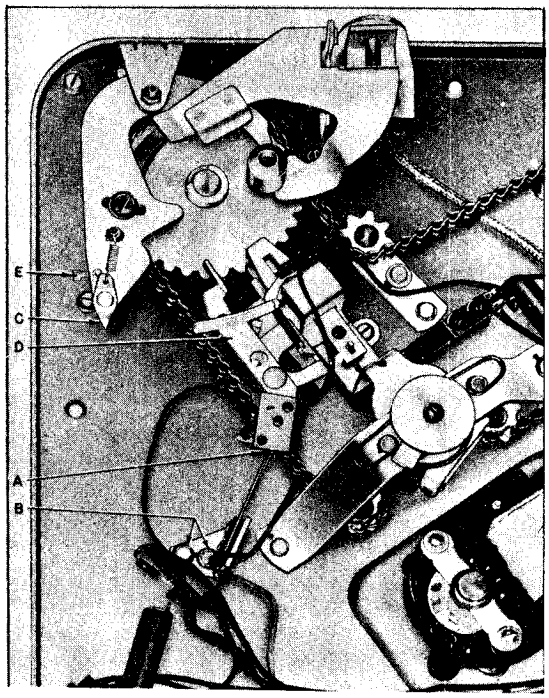

Fig. 8. Cycling Switch and Position Trip Adjustments.

REPLACING THE MOTOR

The Motor is designed for operation on 50 or 60 cycle Alternating Current (AC) depending on the spring bushing installed on its shaft. For 50 cycle operation a 80-452 spring bushing is used. For 60 cycle, use a 80-453 bushing. For operation on 25 cycle current a 25 cycle motor must be installed. When a replacement Motor is ordered, make certain that the line voltage and frequency of the receiver are given.

To replace the Motor, unsolder the connecting leads, remove the Turntable, the three spring mounting clips and allow the Motor to drop out. Remove the spring bushing from the shaft of the defective Motor and install it on the new one. When the new Motor is installed do not draw the connecting leads tight as this will prevent the Motor from "floating" on its spring mounts. Make certain that all the leads are securely soldered and taped.

©John F. Rider

ZENITH RADIO CORP.

REMOVING THE TURNTABLE

To remove the Turntable, hold the Clutch with one hand, and turn the Turntable with the other (see Fig. 9).

To avoid damage when the Turntable is replaced, make certain that the Idler Wheel is pushed inside the rim before the Turntable is seated.

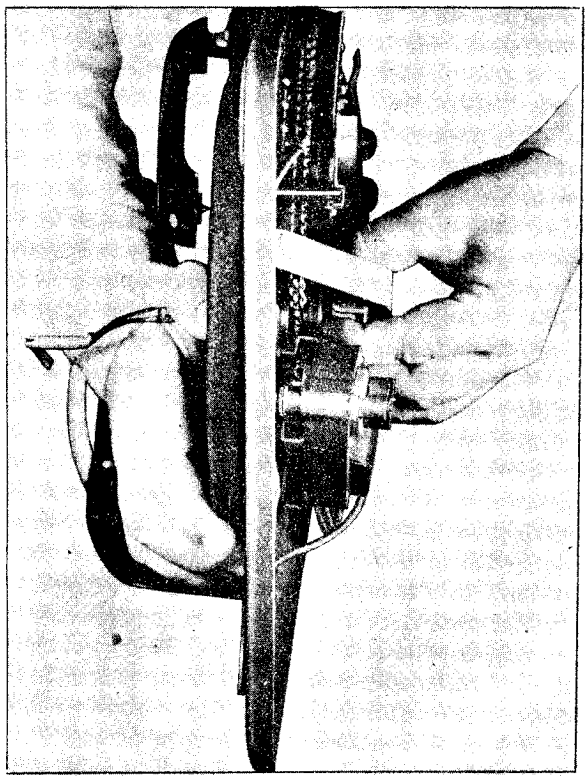

Fig. 9. Removing the Turntable.

REPLACING THE CHAIN

To replace the chain, loosen the adjustable idler (Screws "D," Fig. 10) and remove the chain. Open a link, "B," and pull the chain out. Open a link in the replacement chain and thread it in place. Be certain that the open ends of the links face outward from the Base Plate. (This will prevent the chain from being installed in reverse.) Carefully close the link and make certain that there is no stiffness in its action. Read the paragraph on synchronization before the chain is permanently installed.

SYNCHRONIZATION

When the chain is removed or replaced, the Timing Sprocket and the Selector Sprocket must be synchronized. The Selector Sprocket has a synchronizing mark that must line up with the mark on the Base Plate (see Fig. 2.) The Timing Sprocket has a small slot. The Clutch Release Lever Tip must drop into this slot at the same time the Selector Sprocket Synchronizing Mark is lined up with the mark on the Base Plate (Fig. 2). To synchronize, hold the Timing Sprocket and Selector Sprocket in position, thread the chain over the Drive Sprocket, the two fixed idlers, Timing Sprocket, Selector Sprocket and over the adjustable idler. Set the adjustable idler for medium tension on the chain and tighten the two holding screws.

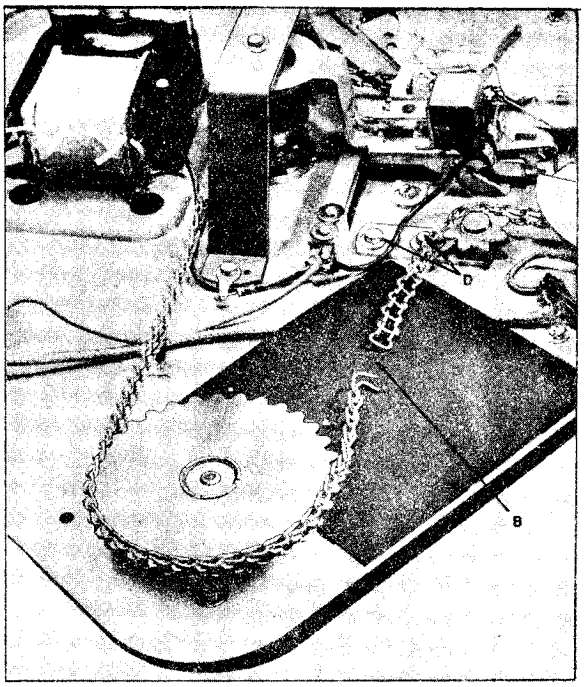

Fig. 10. Replacing the Chain.

THEORY OF THE COBRA RADIONIC PICKUP

The operation of the Cobra pickup is considerably different from Crystal and Dynamic pickups. These pickups generate audio power, while the Cobra controls power generated by a radio frequency oscillator. The 7F7 twin triode tube is a modulated oscillator, detector and audio amplifier. The oscillator operates at a frequency of 2.5 Mc. Modulation is accomplished by changing the energy losses in a tuned circuit. These losses may be represented by an equivalent resistance in series with the reactance of the coil. The ratio of the resistance to the reactance determines the efficiency or Q of the coil. The amplitude of the RF voltage developed across this coil by an oscillator will vary with changes in Q.

The grid coil L_1 and other components of the oscillator are mounted in the oscillator pre-amp chassis, while the plate coil L_2 is in the Needle Cartridge with the vane and needle assembly. The coil is fixed and has 40 turns of No. 40 wire (approximate DC resistance 2½ ohms). The stainless steel vane, which is in the field of the coil, is spot welded to the osmium-iridium tipped stylus.

Any movement of the stylus will cause a corresponding movement of the vane. As the stylus and vane follow the modulations in the record, changes in the mutual inductance between the vane and coil occur (see Fig. 11). In position 2 the vane is at rest; and a constant RF voltage appears across the plate coil. As the vane is set in motion and reaches position 1, it is at its greatest outward swing from the coil, resulting in low mutual inductance, low reflected resistance, higher Q, and a higher RF voltage across the coil. In position 3 it is at its greatest inward swing; resulting in a high mutual inductance, high reflected resistance, lower Q and a lower RF voltage. It can be seen that the amplitude of the RF voltage which appears across the coil will vary with changes in Q, satisfying the condition for amplitude modulation. The position of the vane changes both the Q and L of the coil. Changes in L shift the frequency slightly, and a certain amount of frequency modulation is present, but

©John F. Rider

ZENITH RADIO CORP.

since there is no frequency discrimination it remains undetected.

Since the grid and plate coils are part of a single tuned circuit any variations of amplitude of the RF voltage brought about by the changes in Q across the plate coil will also appear across the grid Coil L_1 causing a shift in the average plate current through the plate load resistor

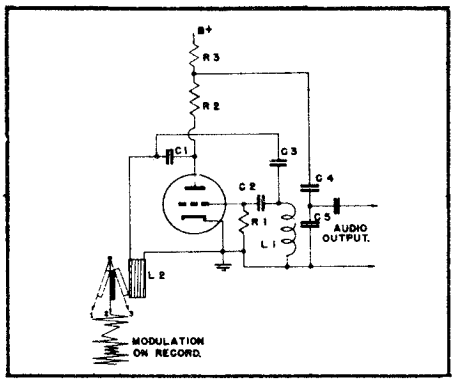

Fig. 11. Simplified Circuit of Oscillator.

across which the audio output voltage is developed. Plate bend detection takes place since only the positive half of the grid swing causes an increase in the average plate current. These changes in the average plate current appear as audio voltage across the plate load resistor.

The 2.5 Mc. RF voltage and the audio voltage both appear at the plate (pin 6) of the oscillator triode. R_2, C_1 and C_3 filter out the RF voltage allowing only the audio component to the grid (pin 4) of the amplifier triode where it is amplified, fed through a shielded lead to the audio amplifier of the receiver and reproduced by the loudspeaker.

TROUBLE SHOOTING

SQUEAKS OR NOISES DURING PLAYING OF RECORDS.

a. Friction between the records on the turntable and the spindle will occasionally cause squeaks. A thin coat of wax applied to the spindle will remedy this condition.

b. Check lubrication.

MECHANISM STARTS SLOWLY AND MOTOR GETS HOT.

a. Check line voltage and frequency.
b. Check lubrication.
c. Motor windings damaged.
d. Room temperature abnormally low.

PRESSING RECORD CHANGE BUTTON ON RECEIVER PANEL DOES NOT START RECORD CHANGE CYCLE.

a. See that the AUTO-MAN-OFF switch is set to AUTO.
b. Check Record Change Switch.
c. Check Cut-Out Switch.
d. Check electrical continuity of solenoid circuit.
e. Check solenoid energizing voltage on motor.

MOTOR FAILS TO RUN EVEN WHEN IT IS ENTIRELY DISCONNECTED FROM CHANGER AND PROPER VOLTAGE AND FREQUENCY APPLIED DIRECTLY TO THE TWO INPUT LEADS OF THE WINDING.

a. Open winding.
b. Damaged or frozen bearings.

RUMBLE AND MICROPHONICS DURING REPRODUCTION.

a. Changer not "floated" properly. Loosen mounting bolts and remove packing block from pre-amp.
b. Motor mounting Spring Clips rubbing on the idler wheel.
c. Motor leads pulled tight preventing motor from "floating" freely on its springs.
d. Noisy 7F7 tube.

NEEDLE SETS DOWN PROPERLY ON RECORD BUT SLIDES OVER THE RECORD GROOVES.

a. Cabinet tilted.
b. Badly worn needle.

NEEDLE FAILS TO CLEAR MAXIMUM LOAD OF RECORDS ON THE TURNTABLE.

a. Check Tone Arm height adjustment No. 2.

CHANGER CYCLES WITH AUTO-MAN-OFF SWITCH ON MAN.

a. Check AUTO-MAN-OFF switch.
b. Chain too tight.

TONE ARM FALLS OFF RECORD.

a. Check Tone Arm set down adjustment No. 1.
b. Check Tone Arm Mounting screws.
c. Changer not level.

TONE ARM SET-DOWN POSITION VARIES.

a. Loose Tone Arm Set-Down adjustment lock screw.
b. Loose Tone Arm mounting screw.
c. Loose needle cartridge socket holding screw.

RECORD IS NOT HEARD ALTHOUGH CHANGER OPERATES.

a. See that the Phono Radio switch is on Phono.
b. Check receiver audio by listening to radio.
c. Check 7F7 tube in Pre-Amp.
d. Check Needle Cartridge.
e. Check Needle Cartridge housing for broken connection.

TONE ARM SETS DOWN TOO FAR IN OR OUT OF RECORD.

a. Check Tone Arm Set Down adjustment No. 1.

CHANGER CONTINUES TO CYCLE.

a. Check Cycling switch adjustment No. 3.
b. Check Record Change switch.
c. Clutch release mechanism sticks.
d. Tight drive chain.

CHANGER WILL NOT CYCLE UPON COMPLETION OF RECORD.

a. See that the AUTO-MAN-OFF switch is set to AUTO.
b. Make certain the record has an eccentric center groove.
c. Check Cycling switch.
d. Check Cut-out switch.
e. Check Clutch Release Arm for freedom of action.

SQUEAKS WHEN CHANGER IS IN CYCLE.

a. Friction between Lift Pin and Timing Sprocket. Apply a thin coat of STA-PUT grease.

FAILS TO EJECT RECORDS ACCOMPANIED BY A CLICKING SOUND.

a. Clutch slips. A slight upward bend of the Clutch Release Arm will correct this condition.

RECORD HANGS BETWEEN SPINDLE AND SHELF.

a. Bent Spindle, or rubber pads on Record Shelf have expanded, causing a decrease in space between Record Shelf and Spindle.

CHANGER DROPS TWO RECORDS.

a. Sharp edge on record. Smooth out with fine sandpaper.
b. Bent Spindle.

TONE ARM STICKS OR HANGS UP DURING CYCLE.

a. Clutch Release Lever pressure on Timing Sprocket too great. Loosen the solenoid bracket and insert a very thin shim between it and the base plate. If the condition still prevails, increase the thickness of the shim.

b. Burrs in synchronizing notch or trip lever. Remove with a file.

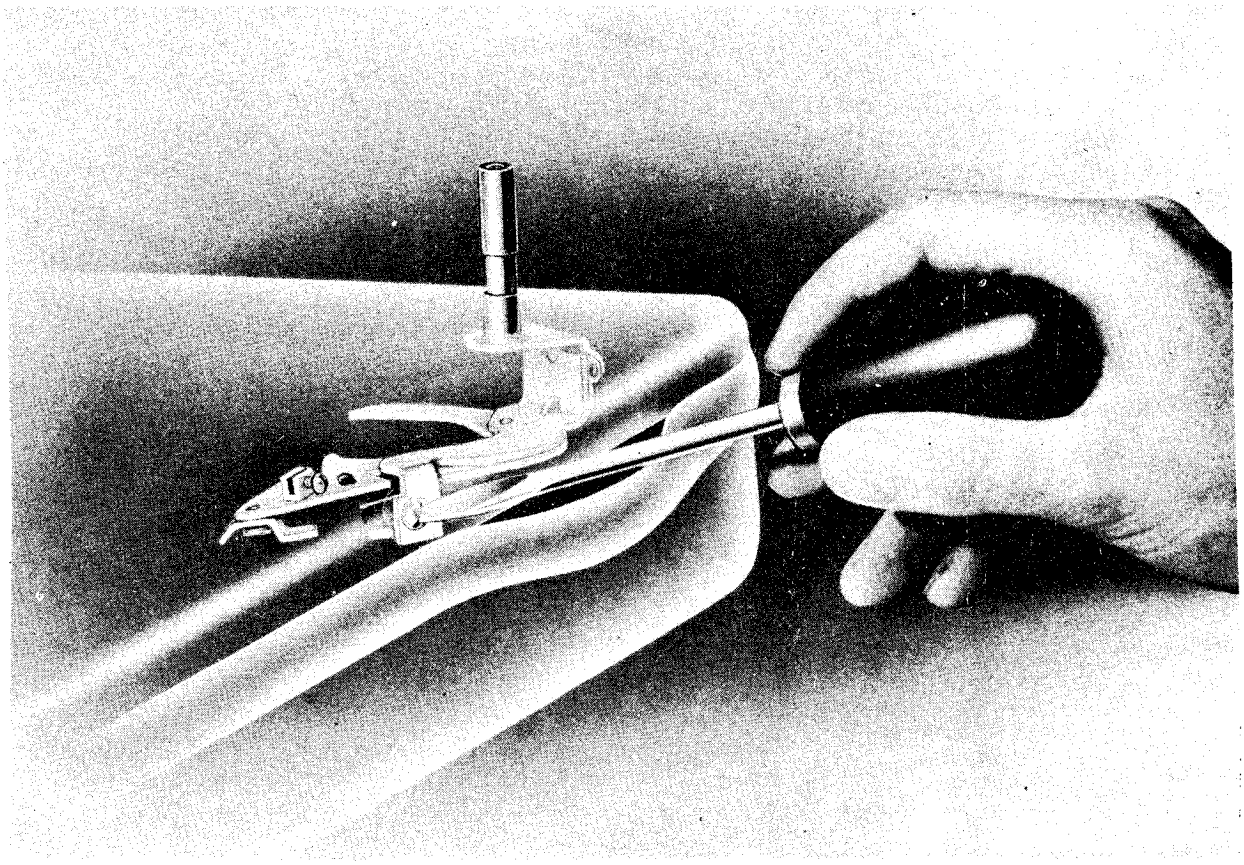
ADDENDA



For convenience, a screwdriver tone arm set-down adjustment has been added to all later production record changers. The adjustment screw can be reached with a screwdriver by pushing aside the ethocel trim strip. The tone arm must be held in the rest position while the adjustment is made. Clockwise rotation of the screw will move the tone arm in, while counter-clockwise rotation will move it out.

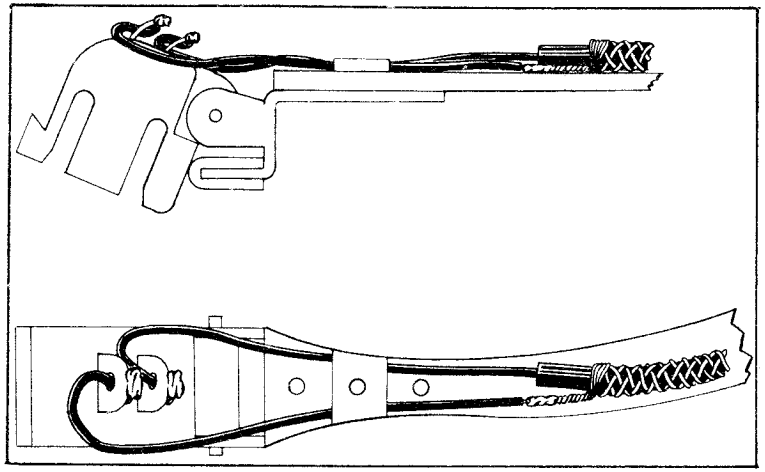

Fig. 13 shows how the leads are connected to the Needle Cartridge Socket. The lead and insulation are run through the hole in the contact and the lead is soldered with a light soldering iron. Great care must be exercised, and very little heat applied as the socket is made of lucite and will burn easily. The complete lead and socket are supplied as S12633.
